11543. 'UNLOCKED' at frequencies under 7.5MHz

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-08-25 22:03:12 UTC
From: Jason Ball
Topic: 11543 Message: 11543

How do to the group.

I'm a fairly new amateur - first licensed 2 years ago and upgraded to the Australian 'Standard' license early this year. While I have several years experience in electronics (hobbiest) radio's are still new to me, so in this instance I was hoping for a little guidance.

I recently bought a TS-850SAT from an estate where it had been shelved for the best part of 10 years. On testing the radio performed exceptionally well and was in top condition, so I probably forked out a little more cash that I should have. Se la vie.

The radio performed well for several days, then I powered up to receive the 'UL' morse. I didn't spend a lot of time playing and based on information on this list pulled the CAR board and found that every capacitor had leaked dialectic over the board. I've now cleaned this up, repaired a couple of damaged via's and scrubbed the board clean - there was significant discolouration on the legs of the 66312's and a lot of stained solder mask - the chips have been cleaned and the damaged solder mask removed to facilitate cleaning of the traces.

The bare copper has now been coated with a protective lacquer and the cap's replaced with higher quality/higher voltage components. I'm fairly sure the board is now 'correct'...

On reinstall on the radio I wanted to test that the initial problem was fixed before proceeding with a cap replacement on other boards and found that the radio works on the higher frequencies, but drops back into the 'UNLOCKED' mode at lower frequencies. The cutoff point for this is exactly 7.5MHz, at 7.499MHz the radio is in error and above this appears to work as it should.

Short transmit tests were performed into a dummy load, an antenna was attached to verify/tune in to a station on 20m to verify receive operation.

To my inexperienced mind I would guess this is a VFO/PLL issue - as the CAR would not be frequency dependent especially with such a clear cutoff point... is this a fair assumption ? I acknowledge this doesn't test all the outputs of the board, but the important signals must be working (IF etc).

My next step is to borrow a CRO (mine is limited to 10MHz) to verify the PLL frequency and then follow the VFO calibration.

Has anybody got any better 'hints' on where to look?

Thanks
Jason.

First rule of repair: Alignment/calibration DOES NOT fix a problem, just makes it harder to find once it is figured out that wasn't the problem.

Step one; get a copy of the service manual.
Step two; Page 98 shows VCO-1 covers the exact range of the unlock condition. Ignore the markings shown in the manual the rest of the book lists them as VCO-1A, VCO-1B, VCO-1C, VCO-1D, and not VCO1-4. Don't ask I didn't write the book.
Step three; got to page 5 and look at the interaction between the different PLL's and what can cause each to unlock.

In this case if the radio works from 7.5-30 mHz then it can only be VCO-1A. Experience tells me it's probably the 10pf trimmer cap.

Now that you know exactly where the problem is an attempt at adjustment is justified. Those trimmers are bad about being flaky so several quick spins on TC1 and see if it will adjust to the book setting. Probably will but will quit again in time. Replace it now or later.

While in there do the spin and set number on Step 8. Do NOT get the 2 TC1's confused. The step 8 TC1 is on a small PCB inside a shielded area. Look at page 107.

Thank you Clif, very much appreciated. I've also noted caps on all visible boards that need to be replaced, so this will simply be part of an extended excercise to refurbish the radio.

I've got a soft copy of the service manual which will have to suffice for now.

Cheers
Jason.

Jason and All:

It would be very helpful to everyone if you could post your serial number of your radio. I also suggest to others posting with problems that everyone try and do the same. It is very helpful to know the serial numbers to try and see if we can isolate some of these repair issues to certain serial numbers of production. My serial number #70400068 which I believe was mfg in 1995. I have had no issues with this radio. Just a suggestion, perhaps others may also benefit from it.

Glenn - K4ZOT

From: wn9d
Topic: 11226 Message: 11547

While transmitting I saw a flash of bright light from the rear of my TS-850. Yep, the surge absorber is fried. First time ever for me. My manual is silent on this, yet I believe it prudent to not operate the rig and disconnect the antenna until surge absorber is replaced.

Presently power output remains at 20 W max CW & FSK, about 50 W on SSB peaks. The power (PWR) control has no effect on power output, only the CAR control does. Has anyone else experienced similar symptoms associated with frying a surge absorber?

Sorry, should have included that. The serial is 31215562 so early model, fortunately it has the 66312's.

I think Clif was on the button for the trimmer cap, although voltages at the test pin dont match the values in the service guide so im digging further on this one. The up side is the radio is fully operational so im happy.

Cheers
J.

The set point will match, the check point is appx and as long as it's in range of the VCO's operating range it's OK.

it's definitely not in spec - although the error may be as simple as me
using the wrong ground point for the measurement.

I'm getting 1.8v at TP1 on the PLL board regardless of the setting for the
trimmer (VCO1 -- TC1). I was planning on verifying this with the repair
tech art the radio club this week as It's more likely a measurement error
on my part.

(ref service guide pages 107, 98/VCO1).

Cheers
J.

Make sure you are adjusting TC1 that is next to TP1, not the other one.

Hi Bob,

That is indeed a PLL error.
Very common error. Most TS850's that I have seen had this problem after some time.
PLL chips need to be replaced or what Kenwood Service did was replacing the complete board.
The bad news is that these are custom chips made for Kenwood and by now they are obsolete.
Even Kenwood does not have them.

Need to know what band? What about the rest of the bands? CW mode and max power and carrier. Probably shorted a few RX BPF diodes as well as killed the rx.

11555. Fox-Tango filter

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-08-29 15:53:34 UTC
From: k4pdm
Topic: 11555 Message: 11555

I am considering buying a Fox-Tango CW filter for my TS-850SAT.

I know that they were good filters. Are they aging gracefully?

In other words, is it possible to expect as-new performance for now and some time in the future?

73 Thanks Paul K4PDM

11556. TS450 out of frequency

Hi all,

My TS450s is a little bit down that the frequency displayed. About 200Hz of the initial frequency in TX. (In TX I display 14.200 and the trx TX on +/- 14.199,8)

I can correct this issue with the Xit, but I would like adjust correctly the trx without the Xit button.

Someone could tell me how to do ?

In RX I have the same pbl.

Hey,

The rit/xit are centered => 0.0
My 450 is transmitting about 200 hertz lower than is indicated on my radio readout.

Does anyone know how I might adjust that, or calibrate it back to on frequency?

11563. dds2 chip brake point.

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-09-02 15:06:56 UTC
From: Fredrick
Topic: 11563 Message: 11563

I'm looking at a 7 mill serial number 850 and was wondering
what the brake point for the new/better dds chips was.
Also do they all have the leaky cap problem or is it
less likely on a late production rig?

Can't wait to get it it will be taking place of my ts-830.
It will be nice to not have to tune anytime I change freq and be
able to work split without the remote VFO(don't have one anyway)
One other question. Is there a way to hook up my sm220 to the 455khz
if stage to monitor the rf in signal?

I've also hooked my 830 on the if2 8.83mhz to my sdr rx and tune the sdr to 8.83mhz and use it as a band-scope. Works well enough. Plus only cost about $70.00 to do.

11564. TS850 and Amplifier Tuning

I have the Ameritron 811 amplifier (600 watt) and I would like to find out how some of you tune up your amplifier when driven by a TS850. I know much has been written on this subject and that's the confusing part.
Do I use the rigs tune button, which only gives 50 watts output, setting up the amplifier with 50 watts drive and then when tuned use the PWR knob to increase the drive and finally retune the amplifier, or use key down cw with full power out of rig and tune the amplifer at full power?

Thanks for your comments.....Bob

Fredrick

You should find a TS850 with serial 5 mill serial its DDS chip is already improve/new one, but this is not an assurance that the caps wont leak, my brother have a 6 mill 850 but still it shows capacitor leak same as his 3 mill 850. So its the capacitor it self is the problem, when i replace those DDS board caps i use higher voltage rating. If iam not mistaken the orig is 10V i replace it with 16V, same lead less type caps.

Hope this helps.

Alex

Bob,

The "Tune" button has no function for tuning an external amplifier. It is a receive only function, used to zero-beat a Morse signal.

I just use CW mode with a straight key, and adjust CAR to adjust drive to my SB-220. If I'm going to operate using CW, I tune the amplifier for maximum output, with grid current no higher than the maximum allowed for my amplifier. If I'm going to operate SSB, I then adjust for best linearity as shown by my monitor oscilloscope.

Tuning for maximum CW power and then using SSB/AM results in severe flat topping (clipping), and a signal that's a mile wide.

Page 181 of the service manual shows they are in a 6x6 matrix. If you would map out which work and which don't you could compare to the matrix and see which data lines are missing. With that info it shouldn't be hard to fix. Or at least isolate where the problem is.

Subject: [TS-850_450_690] Re: Some keys on TS-850 no longer work

Page 181 of the service manual shows they are in a 6x6 matrix. If you would map out which work and which don't you could compare to the matrix and see which data lines are missing. With that info it shouldn't be hard to fix. Or at least isolate where the problem is.

Bryan, The tune button (not the antenna tune button) is also used to help tune for example, with the tune button on, you can key the mic and get about half power out controlled by the carrier control. I use this all the time since my antenna uses open wire feed line.Bob

Bob,

The "Tune" button has no function for tuning an external amplifier. It is a receive only function, used to zero-beat a Morse signal.

I just use CW mode with a straight key, and adjust CAR to adjust drive to my SB-220. If I'm going to operate using CW, I tune the amplifier for maximum output, with grid current no higher than the maximum allowed for my amplifier. If I'm going to operate SSB, I then adjust for best linearity as shown by my monitor oscilloscope.

Tuning for maximum CW power and then using SSB/AM results in severe flat topping (clipping), and a signal that's a mile wide.

Hi Pete

I had the same problem with my TS-450 and it was the interface board where the cable plugs in to the radio that was going bad. I bought another board off of eBay and it's worked fine ever since. 73

What com ports is windows reporting the adapters to be at. If they are NOT showing up, then you may have either the wrong driver, or a defective unit(s)???

11584. new member - missing buttons - wanted!

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-09-14 08:23:08 UTC
From: m6usv
Topic: 11584 Message: 11584

Hi all,

I have just joined the group and pleased to see a info centre for the 850.

Its been a bit of a learning curve as I am new to the hobby with only a year of 'am gear under my belt.

First issue was the rig had been dropped and the face was bashed in, luckily the plastic is only marked and not damaged but a large amount of bending had been required to make the frame straight behind the front facia. None of the buttons in the centre of the radio would touch the buttons at the back of the frame and PCBs so the radio was near unusable.

All that is fixed and last night I set about doing more than receive. I quickly found out the limited operation on 40m where in the UK the band goes outside of the limits of this radio. I don't know the history of the bands in the UK but I can only guess that 20 years ago we didn't have up to 7.2. The manual states that it should have up to 7.3 but it didn't.

Anyways, I'm quite happy now with the radio, it seems good despite seeming a little hard work in comparison to my other radios but im getting used to it and I think im going to warm to it and really like it.

I need help with one thing though.....

Does anybody have any spares for sale? In particular I would like to buy a set of buttons for the front of the radio.

I'm missing 4 buttons in total. The [0] (zero) from the number pad along with its neighbor the [ENT] button. I would be quite happy with any other button from the radio and I will demark and remark with the correct label if anybody has others. I'm also after 2 of the push extension buttons that fit over the [Thru/Auto] and [AT Tune] although these are not important as I dont have the internal tuner to actually use but I would rather not have holes in the facia.

I would also at some point like to acquire a digital board for the recording facility to add to this radios ability.

Hi all and thanks

Denis - 2e0usv - Nr Sheffield, UK

Hi

Not sure what you mean by 'programming'. Most of the settings for the Kenwoods are 4800, N, 8 and 2.

If you are looking for rig control, or CAT, download the latest copy of Ham Radio Deluxe (it's free).

There is an option ther for setting up comports, etc. You can click on 'auto detect' and it will find the comport, baud rate, etc. 73

Tom W7WHY

HRD doesn't program the memory channels. This is the only program I have found (to date) that does: http://groups.yahoo.com/group/Kenwood_Smart_Memory/ (open membership)

It's bare-bones basic, free and pretty straight forward.

Frank.

That is exactly what I was looking for. Thanks! However, it's not detecting my radio. I set the comm port as directed. I enabled data transfer (#17). Anything else I need to do? I got this radio used. It had a hard life and I had to get some repair work done on it. I suspect this function may not be working.

Read the manual.

#1 the data transfer function is to copy one radios settings to another, not communicate with a computer. Turn it OFF

#2 The radio data connection is TTL level not RS232. You must have a TTL-RS232 Converter for the computer to "talk" to the radio.

Clif

11593. Count on Newark in a pinch (slightly OT- but not much)

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-09-22 16:20:57 UTC
From: w7jpg
Topic: 11593 Message: 11593

I have to share some really good news regarding Newark's weekend support. A 47 uF 16V electrolytic to be used on my TS-850's CAR board has been on back order for five weeks. I figured I'd better call before I kicked or the board disintegrated.

I called the customer service number on the Newark packing list thinking there was a 10% chance someone would answer the phone on Saturday. Predictably, the first part of the recorded message stated that they don't do business on Saturday..etc. etc.

Now for the good news. According to the lady on the recorded message, Newark offers a weekend emergency order service. For a minimum order of (only) $100 and a minimum shipping charge of (only) $250, the emergency order team will help if you leave your number for them to call back. I guess hams aren't their major clients.

Thought you all would enjoy this pick-me-up and throw me down on the floor LMAO story.

11594. Service Manual error for IF Unit C-167?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-09-22 22:34:13 UTC
From: w7jpg
Topic: 11468 Message: 11594

I am also preparing to recap my 850s. I was looking for (and found) one of the caps that Clif mentioned needs to be replaced (C-182 audio section). While looking for other 470 uF caps, I was comparing the IF Unit parts list on page 73 in the service manual to the schematic (p154 - lower right corner) and component side view (p142 -lower left corner). Anyway on page 73, C-167 is shown as a 470 uF 10wv electro. When I went to the component page, the cap looks to be much smaller than C-182. The schematic shows this cap to be 10 uF 16V. It appears the parts list is wrong but I thought I would check with the experts. Any more errors like this to trip up us newbies?
Thanks,
Chris

You keep mixing up numbers, C187, C182, & C167. The cap to be replaced is C187 which is a 470uf 10v 105 deg cap. I use a 470uf 25v 105 deg cap.

I have not been happy with Newark's service. Even during weekdays I
have had some bad experiences with them. I decided several years ago
that I wouldn't deal with them unless I absolutely had to.

On the other hand, I have had superb service from both Digi-Key and
Mouser Electronics for years. I ordered some connectors from Mouser a
few years ago and they sent me the wrong ones, which happened to also
be worth about 10 times the ones I ordered. Since I couldn't use them
and felt the parts were too costly to keep, I got a RM # from them and
they paid for the return. And then they sent me a small gift
certificate for doing it! I couldn't complain about that.

I had a similar experience with Newark perhaps about 6 years ago. I had ordered some parts for a project and when the order arrived it included 5 giant electrolytic capacitors that I had not ordered that cost well over a $100. They sent out the right caps that I had ordered when I told them about the mix up and they paid the shipping back on the electrolytics but no gift certificate of any size. I guess that should not be a surprise to either your or JPG. They are usually my last choice for parts as well.

11599. Carrier Output power

Hi,
With the PWR control fully clockwise, 100w on the CAR control is reached at exactly halfway (position 5) of the dial. I see 100w AM,FM,CW and FSK on the meter. after this halfway position is passed there is no furthur power output but the alc begins to rise to full scale by poistion 10. Is something incorrectly adjusted?

Thanks for the info on the C187 replacement. I found EB5AGV's pictures of the audio section of the IF Unit which clearly shows C187, not C182, as the leaker.

Regarding C167: As stated in my prior message, I was looking through the IF Unit parts list for other 450 uF caps and noted C167 which is identified as a 450 uF electro cap. However, the schematic shows this as a 10 uF cap. Hence my question about the error.

All,
Iv'e been using multilayer ceramics to repleace electrolytic caps for years now. They are better caps. You may have to stack them to get the mfd you want. They are made out of rocks and should last forever.

Sounds normal. The book also says when using cw adjust the carrier level to read full scale (to the edge of the red but not above the red). Also when you press the tune button (I think it's number 7??) you can key the mic and adjust the output power with the carrier control but it will only go up to about 50 watts. Your rig is working normal.Bob WE6C

Hi all,

My TS450s is a little bit down that the frequency displayed.
About 200Hz of the initial frequency in TX. (In TX I display 14.200 and the trx TX on +/- 14.199,8)

I can correct this issue with the Xit, but I would like adjust correctly the trx without the Xit button.

Someone could tell me how to do pse ?

11606. CPU Needed Reset after using control program

Yahoo group: TS-850_450_690 (2010 — 2016)

I had the unusual (I think) occurance of having to reset the cpu on my TS850 after using the FLDigi program. Not sure if it was just a co-incidence, or, if there was some error in the control program that caused it.
I have used HRD and also Hamscope and the CAT program tracks perfectly and follows frequency and band switching changes, but, FLDigi seems to be very sluggish when changing bands and sometimes does not change at all.
I do not have a slower cpu on my computer, running at 2.4 Ghz with 3 gigs of RAM.
Just wondering if anyone else has had a similar problem.
Thanks
Joe WR2B

From: k4zot
Topic: 11608 Message: 11608

I have a TS-850S on COM 3 with HRD and I was trying to get CW Skimmer to connect to COM 4 for CAT of the 850. I then tried to connect it to COM 3 while the 850 was still connected to it on HRD - would connecting two programs to the same COM port cause any issues with the 850. I seem to be getting a great deal of noise.static on all bands on it now. Perhaps it is just sun spot activity. Any help would be appreciated.

Also, how do you get the text to read with CW Skimmer. I get the yellow dots and call signs on the right side, but can't get text to read on the bottom text window. I have tried several CW reader programs and I can not get any of them to copy decent text.

Thanks,

Glenn

11610. Sometimes the display - delays lighting up ?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-10-03 20:06:13 UTC
From: johnfaughn
Topic: 11610 Message: 11610

It seems random , but frequently when turning on the rig there is a delay for the display to light up and the time varies from no delay to maybe 1 1/2 seconds .
When I 1st got the rig , I replaced all the SMD caps on the CAR board , a through hole on the display board and one on a board in the bottom of rig .
Another issue is the display is off up to about 13 Hz at 10m , about 6 Hz on 20m , 3 on 40m ?
Thanks
John

John

Hi, for the display being off center or the TX & RX freq is not center the possible problem is in the PLL / VCO side, need to check their calibration or setting based on the service manual there is a procedure how to check and adjust using test equipmen.

For the delay in display, the problem might came from the display inverter circuit powering the flourecent tube for the LCD backlight. some capacitor and resistor value maybe out of value already that is why the oscillation to power on is delayed. You can check it inside the metal enclosed circuit in the display board. A friend of mine repaired a blank LCD display, the cause is this circuit he just replace capacitor and resistor.

Hope this helps.

Dave and .
I need to do some checking , just after posting I thought about that , in my shack I use something like a power-strip , to shut down the power supplies and other gear .
I may be a little quick sometimes between hitting the power-strip and on button of rig , so I will focus on having some delay between turning on PS & radio .
Now I will have to post another new issue , loss of out-put / TX power after a few moments , worked fine during tune-up procedure getting ready for a 10m net , put in CW mode , lower power to about 1/2 and key up to tune external tuner , then part way through check-in to net , the cross-needle meter in tuner quits moving / no output .
Thanks
John

John

Pls check the DC-DC board i trouble shoot a TS850 with this symtoms, the one i check has its power output doing up and down. There is a modification on the file section. To check if this is the problem the output of the board should be -6V during TX, if flactuating or no output this is the problem

Alex

Alex , I have been reading up on a few of the repair / mod web sites that I have gathered and had matched up the symptoms with that fix . I have not been finding much in the way of component values of the parts involve , or as much of the test point numbers , at least in the way they make sense to my way of thinking , most of my diagnostic work has been in the automotive work , emissions & computer , and the manuals would have diagnostic trouble trees with pin-point testing . I do have a copy of the service manual , but have not found much yet . Hope to have testing and a parts list in the next few days . Thanks John KD0CAC 73 On Fri, Oct 5, 2012 at 2:43 AM, alex_barbon wrote: > ** > > > > John > > Pls check the DC-DC board i trouble shoot a TS850 with this symtoms, the > one i check has its power output doing up and down. From: ag1pct
Topic: 11617 Message: 11617

I posted a pic to the forum called AG1P_CAR_TS850.jpg. Until tonight I have been remiss in checking my CAR board. There is discoloration around some of the caps but no signs of actual leakage. The discoloration is dry in every case and alcohol does not remove any part of it. Is this the result of a past repair or do I have leaky caps that need replaced? The radio works fine right now with great reports.

Topic: 11617 Message: 11618

Yes that is showing leaky caps .
I would suggest unplugging the rig and not using till you get it re-capped on the CAR board .
And check for all the usual suspects , other caps , memory battery .
I am under the impression that the cap damage is what kills the DDS chips , then you have a parts rig .
I suggest that not just replacing caps , but the dark area is the coating over the traces has been lifted by the cap-leaks and needs to be removed , cleaned and re-coated .
If I was at my other computer , I would show pic's of my before & after repairs .

Hello everyone, I have a question about if the tuning (vfo) aluminium knob from the TS-450s is identical in size with the TS-850s vfo knob? by pictures it looks the same but who knows? I´m have a TS-450s but my vfo knob has lots of scratches and i want to buy a new one. Thank you in advance for the good information. Best 73, Ed. OA4BSA.

11620. YM6631 chips

A while back I replaced the YM6631 chips in my TS-850 with the YM66312. I did so to forestall any future problems -- the radio was working fine at the time.

So I have four working (to the best of my knowledge) YM6631 chips, date code "9102". I removed them using low-temperature Zephyrtronics rework equipment, so they haven't been exposed to full reflow temperatures. They've been stored in anti-static packaging.

They have solder bridging the leads that will need to be wicked off; a couple of pins may need a slight realignment.

Contact me if you have any interest in them.

I had this happen with my 850, sometimes the display would not come on until I moved the tuning knob, then it would come on and be fine. I sent it out for cap and battery replacements and I have not seen this happen since. There was a display cap replaced so that may have been a contributor in my case.

11626. TS-850S age vs serial number

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-10-07 15:36:07 UTC
From: yg@internetsmallfry.com
Topic: 11626 Message: 11626

I am considering purchasing a TS-850S serial number 3080xxxx (I'm told that for some paranoid reason I should not post complete serial numbers in public forums) and am trying to estimate its approximate age.

I'm told that the TS-850S serial numbers are decoded thus:

Subtract 2 from the first digit to get the year (e.g. 3080xxxx was manufactured in calendar or fiscal 1991);

The next two numbers are the month, either from the beginning of the calendar year (in which case the above example would be August of 1991) or from the beginning of Kenwood's fiscal year (in which case the above example could be anywhere from August of 1991 to sometime in early 1992).

The rest of it is the sequence of manufacture in that month.

Others have said that the first digit is the year of mfg, without subtracting the 2, in which case the above example would have been mfg in 1993 or perhaps early 1994.

What is the correct answer?

I'm told that I should look for one made in 1995 or later, to avoid some well-known problems... is that correct?

The asking price for the one I'm looking at is $615, which seems roughly comparable to what these radios get on ebay... if the radio is fully functional, does $615 sound like a reasonable price? It's local to me so there is no shipping involved.

Thanks...

11629. TS-690 ALC/SWR meter behaving strangely

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-10-08 01:02:25 UTC
From: Mike34230
Topic: 11629 Message: 11629

The lower bar of my TS-690's display meter has all of a sudden begun to appear during receive, when normally only the S-meter functions. The amount of bars lit seems to follow the signal strength somewhat. The line below (dB -20 ____ 0 ____ 10) is illuminated as well. I can toggle through the TX-M settings and it doesn't seem to affect the display, but it does work as expected when transmitting.

The radio seems to transmit and receive just fine.

Anyone know if this is a serious problem, or if it is a sign of something beginning to fail?

Thanks, Mike - AA1AR

11630. Re: [TS-850_450_690] TS-690 ALC/SWR meter behaving strangely

Mike,
What you are describing is the Receive Meter (RX M button)
function. It will show you the audio level of the received signal
with AGC applied. Doesn't sound like any problem at all.

This is one of my favorite features of the 450/690 that I wish other
rigs had. Using it, combined with the RF gain control, you can
reduce RF gain to the sweet spot where AGC no longer affects the
received signal. This is the point at which the RX meter backs off
the 0dB point. At that sweet spot, you've maximized the signal to
noise ratio. Beyond that (more RF gain), all you're doing is
increasing the noise level while the AGC throttles back on the main
signal. Below that, you are attenuating everything (signal and
noise) and AGC is effective. Great for CW work.

While I'm posting (which I don't do a lot).. another less known
feature of the 450/690 is in the FM mode, the transmit bandwidth is
set by the 455 KHz Filter setting. With the filter in 12KHz mode,
you transmit wideband FM. With it in 6KHz mode, you're transmitting
in narrow band FM. So while you think the receive IF filter mode
affects only reception.. it also affects transmit FM
bandwidth. Just a bit of trivia.

Rick ,
without going back through some saved links , that sounds about right on the date of manufacture info .
As far as the problems , leaky caps , if you can test drive the rig before paying , and the rig operates OK .
Then on top of that , if you are confortable with SMD soldering , I would take home and look at the various caps and the surface of the boards for dark staining around them and if it is a earlier rig , replace all the caps on CAR board , and a few through hole through out the rest of the rig and lastly a memory battery change .
Here is a link with pic's ,

http://jvgavila.com/wb7.htm

I'm of the impression that if the caps on the CAR board get bad enough that is what kills the chips .
When I got mine from a SK estate , it worked but showed signs of issues , off frequency , drifting ect. , took home , opened up and found all the caps in the link were leaking , so replaced all and 2 yrs later still operating .
Now when there is some anomaly , I open up and look for more leaky caps :)

Thanks, John. I'm actually not that good at SMD soldering anymore... used to be able to do it but then again I used to be better at a lot of things :-(. I recently attempted some repair work on my IC-706 and ended up burning up two traces on the PCB, so I ended up putting it in a box and sending it out for repair. So, if I'm going to get an 850 at all I'd prefer to get one that perhaps was built after all these problems were fixed, if in fact all these problems were ever fixed during the TS-850S production run.

When exactly (what years) was the production run of these things?

Rick ,
I can not remember for sure something like 1990 - 2000 just a guess at memory .
What you may do , if the seller would allow , is if its an earlier version , open up to look at CAR board and if there are signs of leaky caps , then get a quote for repair and ask for a discount .
There are a couple of guys here that are repair shops , Carl is the name of one of them .

11635. Re: TS-690 ALC/SWR meter behaving strangely

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-10-09 17:35:26 UTC
From: Mike34230
Topic: 11629 Message: 11635

Thanks Paul,
My 690 has been sitting idle for so long I must have forgotten how to use it. I've been running it for the last month or so, and was using it on a digital mode, switching back and forth between ALC and SWR with the TX M button. Who knew there was an RX M button right above it? Time to put on reading glasses and get out the manual!

Page 16 says:

"RX M key
When this key is pressed during reception, the dB display turns on and off. The AF level is displayed on the scale (dB), independent from the AF volume setting."

Based on the manual's explanation of the function, I can see why I forgot about it. Thanks for explaining how to actually use this feature! I'll leave it on now to get used to it.

Good to know about the FM bandwidth!

Thanks for taking the time to answer my question, Paul. Next time, I'll read the manual again before posting!

I've been using the LDG-100 with my 690 and it works fine. Just a simple coax connection between radio and antenna.

Increasingly, I'm trying to get a way from non-resonant antennas, but the LDG has handled my G5RV just fine.

Cheers,

Trent

11643. TS-850 Transmit Problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-10-10 18:12:37 UTC
From: raydeeoh08
Topic: 11643 Message: 11643

I mainly use my '850 for digital modes but also for remote operation via HRD/Logmein.com to access our local Emergency Comms net on 80m when I am away from the home QTH.

Recently, my '850 has developed the following problems:
1) VOX stopped working (both SSB and CW break-in)
2) When I first start transmission in PSK, the wattmeter indicates about 50% of the normal output (I use about 40 watts max)
3) After a second or so of transmission, the wattmeter indicates full output power
4) SSB has same condition as PSK, that is, on initial transmission, power is half or less of normal output (100W or so) and then slowly moves up to full output power.

Everything else works fine. I haven't been back to the home QTH yet to pull it apart, but will be going this weekend. Where to start the investigation?

Thanks one and all for any assistance.

73,
Robert

I can also highly recommend the LDG. Simple, reliable and cheap. Won't handle more than 125 watts of power, but that's no issue if you don't intend to use an amp.

I actually repeated the process twice, making sure that even the power was unplugged before setting the switches to the ON position. Then, re-setting the microprocessor.
I even went so far as to exercise the switches ON and OFF a few times in case the contacts were a bit dusty, but still the same thing.

> Hi all...just installed the 3 optional filters in my TS-850, YG-455C-1, YK-88C-1 and YK88SN-1. I also set the switches on on the top board to ON for number 1,3 and 4 and then Reset the Microprocessor.
> I expected to find that all of the filters showed up on the front display, but, none of them do.

That is correct..when I hit the filter buttons, they do not scroll through the entire 4 choices for each of them, the lights are exactly the same as when I did not have any filters at all installed.
I am almost thinking that the filter switching board might need replacement/repair ??

Does the manual say to reset the microprocessor? I don't think I had to.

If I remember correctly the status of the switches are only read at power up. Switch them to the proper position with the power off and turn on the radio, then see if it works.

No, the manual does not say to reset the microporcessor, but I found that on some website - I figured it could not hurt.
Anyway, I have done all of the suggestions and still the filters do not show up when I scroll through, I'm stumped.
Maybe I need a new filter selection board ??

11658. TS-690S Power Loss, All modes, All bands

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-10-29 03:04:58 UTC
From: Roberto
Topic: 11658 Message: 11658

Hello,
Greetings from El Salvador, Central America, YS country.
New member here and thanks for letting me join.

My TS-690S is only providing 5 watts output in all bands and all modes.
Have tried with a dummy load and with and external power meter and same thing.
Apart from the power output problem, the rest seems to be working fine in all respects.

The ALC barely lift up too.

Has someone experienced this problem that may suggest an approach to solve it?

Thanks in advance.

If the switches are all off they should have 5v on them. Trace back to the Digital unit IC1 pins 43-46 and they should be toggling H or L as the individual switches are moved. If they do it becomes serious.

11660. New DC-DC board solves the TS-850 ALC problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-10-30 01:34:56 UTC
From: Lars
Topic: 11660 Message: 11660

Hello group!

I refer to a new link in "Links -> TS-850 Tech Info, Mods". The link is named "New DC-DC board solves the TS-850 ALC problem".

The link describes how a new DC-DC board can be built for the Kenwood TS-850. The new DC-DC board contains just 4 components: The voltage inverter ICL7660, one resistor, one capacitor and one 78L08.

It means if the data lines are switching correctly on the IC then it will have to be replaced. It's an I/O chip that talks to the processor. And it's a discontinued part.

Date: 2012-11-08 15:59:34 UTC
From: w0iea
Topic: 11669 Message: 11669

For sale: Kenwood TS 450SAT
The price is $600.00 firm.
This radio is in very nice condition. No scratches, never mobiled and non smoker.
The only known issue is VOX gain is low and has always been that way. I believe the problem is a bypass cap but I have never opened the radio to attempt a fix since I don't use VOX anyway.
Included with the radio are the power cable and original manual, no mic.
Prefer local pickup and inspection in Boulder, CO, but will ship for $35.00.
Payment will be money order, bank check, personal check. All will be held until bank clears. Of course cash for local pickup.
Jack W0IEA 303-443-6741.

The same DDS IC, YM6631, was used in both the 450 and 850. The replacement IC, YM66312, was used in later models of the 850. I don't know if anyone outside of Kenwood knows exactly when the new IC's were used but the rule of thumb is 2xx-3xx SN's had the old unless they have been changed. The same serial number sequence should follow for the 450 but I've never really tracked the 450 so am not for sure.

11678. TS850 frequency jump on receive

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-11-19 18:06:16 UTC
From: g3ltf@btinternet.com
Topic: 11678 Message: 11678

Thank you for allowing me to join the group. My TS850 has quite suddenly developed a bad fault When I go from Tx to Rx on SSB,with either sideband, the Rx comes back on a different frequency, randomly but within a kHz or so. The tx freq is perfectly stable and the fault is not there on CW. Its as if the BFO was jumping around each time it come back to receive. Ive taken out the DDS board and I'm in the process of cleaning it up and replacing the caps (following the info from the files section) and hoping this will cure it but has anyone else experienced this fault? If its due to something else I'd like to know while I have it opened up on the bench.
Thanks &73 Peter G3LTF

11679. TS850 frequency jump on receive ..fixed

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-11-20 17:22:14 UTC
From: g3ltf@btinternet.com
Topic: 11679 Message: 11679

I replaced all the electrolytic capacitors on the CAR board and continuity checked all the tracks that could have been affected by leaking corrosive electrolyte. I found one track, from pin 53 of IC2, close to R65, that was etched through completely and I carefully bridged it. The combination of all this has cured the fault. I would urge anyone who hasn't replaced the CAR capacitors to do so, following the procedure in the files section.

11680. monitor audio with AM

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-11-21 03:09:41 UTC
From: E
Topic: 11679 Message: 11680

I noticed the monitor (audio) feature of my TS-850 works only on u/lsb,
not AM. Is that standard for your 850 as well? Or is it possible I am
not setting something correctly?

Thanks for feedback.

From: w4bss
Topic: 11681 Message: 11681

Hello everyone!

I just bought a pristine Kenwood TS-850SAT with all the filters installed and auto tuner. Im the second owner of it. What should I look for if problems start to show up. The serial number is 60 Million and I was told this was close to the last ones made and just about all the bugs had been worked out.

I know the original owner had a updated chip installed?? he said it was a common problem with the TS-850. Im not sure maybe someone will know what was done.

Also this radio has some smooth audio on SSB!

73s and have a Happy Turkey Day!!

Subject: [TS-850_450_690] TS-690S Power Loss, All modes, All bands

Hello,
Greetings from El Salvador, Central America, YS country.
New member here and thanks for letting me join.

My TS-690S is only providing 5 watts output in all bands and all modes.
Have tried with a dummy load and with and external power meter and same thing.
Apart from the power output problem, the rest seems to be working fine in all respects.

The ALC barely lift up too.

Has someone experienced this problem that may suggest an approach to solve it?

Thanks in advance.

73 de Rob.

Check the CAR board for leaky caps, you can find a wealth of info online for the 850. They are great radios and where ahead of their time. Check out the page below.

Ditto regarding Tom's comments. I'm sitting here tonight using my TS-850S that I bought a long time ago, new. Set of Kenwood filters in it. Plays like a top. Old chips but I have a new set standing by. Been to Clif at Avvid a few times but that is to be expected. Still get a strong 100 watts out of it. Just a great rig. My other rig is a TS-590S. It does have a quieter receiver on CW but I could still get the job done with the 850.

Topic: 11687 Message: 11687

I have a TS450S (no tuner) for sale. No known problems with any operation functions except the M.CH/VFO CH switch sometimes jumps frequency when tuning with it. It has no effect on any other operation. It has the stock filters and microphone. The only option is the VS-2 px Voice Synthesizer. Cosmetically it is a 7 and I can supply 9 digital photos. I don't use it much except for receiving. It comes with the original box and operating manual and a CD with the the repair manual. Asking $335 plus $25 shipping. I also have the PS53 power supply for sale for $75 plus $20 shipping in the original box. PM me if interested. Jim

I just joined the group and thought an introduction was in order. Op is Dave, KD8MJB. I was on the air in 63 with a novice ticket, let it expire when I went into the USMC, now back on the air as of 2009 and loving every minute of it, just need to work out a way to find more minutes per day. I am now retired after spending 45 years in electronics and computers.

I just picked up a 450sat at a hamfest a month ago, but have not had time to try it out. I'm looking forward to checking this unit out and putting it on the air. I've always been a Kenwood man, currently running a ts-480sat.

Thanks for allowing me to join the group.

Topic: 11692 Message: 11692

Hello!
I recently got an SDR and I would like to connect it to my TS-850 but I haven't been able to find information on how to make the connection.

- Can I just run a cable from the IF-out connector to the antenna input in the SDR or do I need something else in the line?
- What type of jack fits properly in the IF-out connector?

These questions might be a bit obvious but I prefer asking over breaking my equipment =)

Thanks for the help in advance,
Helmut

I connected a softrock SDR to my TS-850 with no problems.

I am away from home, so cant be too precise in my comments, but I am sure the connection on the back of the radio is a "phono" or "RCA" audio jack. I will double check when I get home!

You can connect the SDR directly to the IF output, but in my case with the softrock I found the IF level to be too low!

This is probably due to the low impedence of the SDR antenna input.

I constructed a simple amplifier using a MMIC, though any amplifier (approx 15db) working at the IF frequency of 8Mhz will do. I recal that the IF output is buffered inside the TS-840, so high impedence amplifier is not necessary, but probably desirable!

I dont know what kind of SDR you have, but if it is a fixed frequency one (like the softrock) be careful selecting the center frequency so the wanted signal is slightly off from the passband center.

This arrangement worksfine, and results in a panadaptpr display, or a second reciever, perfect for working DX stations operating "split" (listen on the DX station transmitting frequency, and listen arround to see where the station is listening in the pile-up!)

Software defined radio. A really great inexpensive entry to the field of SDR is the Softrock Ensemble II. I've been having a lot of fun with one. They are available from www.fivedash.com.

I'm not connected to the company in any way except that I'm a happy customer.

Software defined radio. A really great inexpensive entry to the field of
SDR is the Softrock Ensemble II. I've been having a lot of fun with one.
They are available from www.fivedash.com.

I'm not connected to the company in any way except that I'm a happy
customer.

11698. FW: Connecting an SDR to TS-850 IF out

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-12-11 17:40:15 UTC
From: Steven Fischer
Topic: 11698 Message: 11698

I just did this☐ I made my own cable out of RG8U and used an RCA connector soldered on one end for the 850S rig and a male BNC for the LP-PAN box on the other end. Works nicely. Are you using and LP-PAN or something else to interface with your computer? SDR just refers to the software as far as I understand.

Thanks Steve!

Nice to see that it's just a simple cable making chore, I'll get right on that :-)
I am using an AFEDRI SDR to test the principle and see about getting a fixed-frequency radio to replace that later on.
SDR is an abbreviation of "Software Defined Radio" which to me sounds like it would cover both the software and the hardware.

Thanks Peter!

The IF-out jack looks indeed like an RCA-connector, I just wasn't sure if it was really that simple.
I have an AFEDRI SDR which is freely tunable over HF so crystal selection is not a problem. It probably doesn't make much sense plugging it to the TS-850 since I can tune that SDR on it's own, but if I get the principle working I'll get a Softrock with a 8.812 xtal.

11701. Re: [TS-850_450_690] Re: FW: Connecting an SDR to TS-850 IF out

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-12-12 05:06:18 UTC
From: Zack Widup
Topic: 11698 Message: 11701

The heart of the SDR is the Tayloe mixer, which digitally samples the frequency to be detected in quadrature. The quadrature signals are fed as mixing products to combiners which make them into "In-phase" (I) and "quadrature" (Q) audio signals. These are then fed into a stereo soundcard. Computer software processes the soundcard signals and decodes them, displays them on a spectrum scope, etc. You can see 96 kHz of spectrum at a time with a soundcard capable of a 96 kHz sampling rate. The popular software programs allow you to tune in to any signal in that 96 kHz passband and decode it as CW, USB, LSB, AM, RTTY, FM, etc.

So an SDR radio has a minimum of hardware but it does need some. It's pretty amazing what the software can do. For instance, you can record that 96 kHz segment you're listening to and play it back later, tune to the different signals in the recording, etc.

That's my crash course in SDR.
:-)

I had fun the other night watching and listening to a pileup on 40 CW with my SDR receiver.

Every time I key the transmitter, the ALC surges to max and cuts the outpur pwr to zero. If I rapidly tap the push to talk tab on the microphone then it "corrects itself" and transmits correctly showing the correct amount of ALC and output power.

Any thoughts???

Tnx,
Frank

Date: 2012-12-15 18:46:21 UTC
From: Joe Cotignola
Topic: 11708 Message: 11708

Clear Day

Hi all - I have a 30mil serial number TS-850 and in the past month or so I have had to re-set it at least twice after finding that I cannot change Bands, Modes and any other function that require a button press - they are all in-operative.
As soon as I re-set the rig, all of the functions work again.
This is the same radio where, after installing filters and setting the switches, the do not show up as a choice when pressing the 455 or 8.83 buttons to toggle through them.

Should I be looking at replacing a board and if so, which one - I am guessing the Digital Board ??

Any help/advice would be appreciated.

11709. Kenwood TS-450s(at) will not stop scanning

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-12-16 20:17:35 UTC
From: JJK
Topic: 11709 Message: 11709

Hello, I am new to this group and would like to say hello. I am W4JJK and have decided to expand my HAM experience. I just purchased from eBay, a TS-450, and am working on my General also at the same time. However, the TS-450 will not stop scanning. It seems everything on it is in working shape except it will not stop scanning. I did not get a manual with it, but found one online. I have tried most of what I thought would help, but to no avail at this time. I am just wondering if I lost my $450 on a broken radio and if so, has anyone experienced this and knows whether or not it is fixable, and so on?

Thanks, Jim
W4JJK

Jim is the button stuck. You might try getting a little tuner cleaner behind that button. It may have dust in there. I doubt that you have a serious problem, perhaps more mechanical than anything. If you are stumped, Cliff at AVVid will do you an excellent job of repairing the radio. They are too nice a radio to give up on. I know we don't want to spend any more than we have to, but sometimes it comes to that. He just did some work on a TS430s and its like new since he had it.

Hi Dave, thanks for the reply. I just thought of something and maybe I am looking in the wrong place. It only scans continuously in the forward direction. Maybe the UP arror is the key that has the problem. The SCAN key seems to do all functins correct and reacts as expected when used. Also, while it is doing this, the transmit will not key up either, if this is any indication of something. It just keeps counting. I will look at the UP arrow when I get home today. I have used ALL of the power ON hold this key, hold that key options also, nothing stops it. It goes to 40,000,00 then stops. Never counts backwards, only forward or UP.

Still with problems.
I have a hint. I left it on for longer and it started to beep PL PL PL
Looks like the PL is not locking up.
I guess it is getting worst.
At the end, the frequency on display disappear and was replaced only by dots.

Can someone kindly suggest an idea?
I will open and clean all the boards.

Way off topic for this group. You would probably get better answers on a VHF forum.

Mike...I have seen an aftermarket ctcss board installed into radio's be it a typical ham rig or a converted commercial ie Motorola, GE, STANDARD radio. The tone frequency is set to one frequency and wired for tone enable (TX) and/or decode (RX). The radio DOES NOT display the tone frequency - it is set once and forget it. These tone units are under $50 CAN. Other than being stuck on one frequency, they work very well - just remember the user cannot turn the tone off or on. I don't believe the tone board is in the SSB/CW modulator circuits, just FM mode. Been many many years since I worked on one.Good luck and let the group know how you make out.73 es Merry ChristmasTom VE3THR

thanks guys I have now found a Kenwood TR-751E group, BTW the ctcss board is called piexx and I have seen they sell for $50, my on air contact said £10 I am sure that is way less than $50 all this before the shop guy put the board in the FM line, mind you I was silly a few years ago I sold a Radio Shack tone dialer that I could have put before the mic, we live and learn.
Subject now closed.
Many Thanks too both guys. Mike M3EMB.

Serial number range... 2xxxx..., 3xxxx..., etc? Or, does it have the later DDS ICs (pn YM66312) that don't die an early death and are now unobtanium?

Which CW filter... Kenwood YK88C-1, YK88CN-1, YG455C-1, YG-455CN-1, or InRad #22, #104, #186, #305, #528?

Any other options or standard items such as ATU, microphone, power cord, etc?

tnx es vy 73,
Bryan WA7PRC

I have a 30mil serial number 850 that locks up on occasion. I cannot change bands or use any of the push-button functions.
The only cure is to do a re-set.
I am guessing the Digital board needs replacing but would appreciate any confirmation of this before I do the repair.
Thanks in advance

Good luck on finding a good digital board.

Most likely the battery has leaked. There are several daya lines that run under the battery and can become intermittent when the acid damages the thru holes or traces. Start there.

11734. TS 850 IF filters alignment

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-12-24 15:11:11 UTC
From: ik5vlp
Topic: 11734 Message: 11734

Hi all,

on my excellent TS 850 I have installed the original 500 Hz filters on both IF (8.83 and 455). Receiving CW I have the following situation: with pitch e.g. at 750 Hz, the central portion of the bandwith is shifted down of about 130 Hz: with SLOP TUNE (only moving "low cut" till hour 9) I can adjust this difference.
My radio has the TCXO and is perfectly tuned with a reference oscillator - checks were made with a spectrum analyzer - slope tune windows calibrated as the service manual procedure. So I guess the windows of filters are not perfectly centered on the pitch value, and again if I insert the 270 Hz filter on 8.83 IF, just the same problem (I have to adjust the "slope tune low cut" even further).

Are these 130 Hz a passable value or can I do anything (easily) to align the filters? And if possible, how ?

Thanks in advance for all your suggestions, and I take this opportunity to wish you Merry Xmas and happy new year.

Best 73 de Alex - IK5VLP

Align the carrier oscillators per the SM and see what happens. Also the 850 is designed for an 800 hZ cw pitch.

Hi Alex,

You say, you installed the original filters. You probably mean Kenwood filters ?
I remember having read something about different versions of these filters, one part number ending with -0 and another -1.
As far as i remember, they should haven slightly different center frequencies. 100 Hz i believe...

Check what version you have. Maybe a track to follow ?

73, Patrick

Hi All. I just bought a TS 450S. I made my first contact with the rig. Everything seemed to work well except for one thing. Using the original stock hand mic and tuned up on 40 meters to a resonate antenna and a flat SWR, I had to turn the mic gain almost all the way up. My contact was also using the stock hand mic on a 450S and he had his gain in the 9:00 o'clock position vs me having mine in the 3:00 o'clock position. My voice peaks were just under the ALC. Is this normal for this rig? Thanks. Ken, WA5REO

It depends on your voice and how far from the mic you were. The hand mic is designed to be close-talked, less than an inch. If you were that close then something else is wrong.

>

Is the PROC on?

I find that my radio behaves exactly as you describe when I switch off the PROC, speak in a normal tone at roughly 4 inches from the stock mic. With PROC off I get no movement on the ALC meter and when I switch it on I get full scale deflection. (Or whatever you call FSD on a segmented LED meter. :)

Frank.

Thanks to all who replied. Clif, I had the mic as you said, about 1 inch from my mouth and speeking a little loud. I normally use a desk mic on my yaesu and I don't have to speak very loud at all. I did not have the processor on. I will try it with reduced power and see what happens. Also, I had the carrier control turned all the way counter clockwise. Thanks to all. Ken

Using the original stock hand mic and tuned up on 40 meters to a resonate antenna and a flat SWR, I had to turn the mic gain almost all the way up. My contact was also using the stock hand mic on a 450S and he had his gain in the 9:00 o'clock position vs me having mine in the 3:00 o'clock position. My voice peaks were just under the ALC. Is this normal for this rig? Thanks. Ken, WA5REO

What did your contact say about your audio, power? How did it sound in
the monitor?

11744. TS-690 no display or audio

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-12-27 02:49:28 UTC
From: Mike34230
Topic: 11744 Message: 11744

My TS-690 was on in receive mode and the audio quit. I looked over at it and noticed the display was blank also. I shut it off and turned it back on, and all seemed fine for a short time, but soon the display and audio both went out again. The next time I powered it up, I noticed the RIT button, when held pressed, would turn on and off the RIT very rapidly. The time that it would behave normally was less each time I turned it on, until now, where it will no longer display a frequency at all. It will power up with no display (a faint glow but no segments lit), or with all segments of the display lit, or sometimes with every other segment of the meter lit.

I opened it up and found the battery was discolored and had leaked a bit, but it was at 1.8v and still maintaining the memory channels. Pin 21 of the ROM chip (IC-2) had some corrosion, but the part of the pin that went into the socket is shiny. There are a couple of specks of corrosion on the traces that run under the RAM chip (IC-3), but there is still continuity (1/2 ohm) from one end to the other.

I replaced the lithium battery, but no change.

Any ideas?

Thanks, 73, Happy Holidays,
Mike - AA1AR

I like the hand mic personally. That is all I have ever used. I would spend a bunch of money on a new mic until I figured out what was going on. Good luck Kenneth.

11748. TS450 & strong noise level

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-12-28 11:09:48 UTC
From: isabelle.fourias
Topic: 11748 Message: 11748

Hi all,

After a long while, I turned on my trx and I got a lot of noise above 21.5mhz. When it cold I have S7 with the 6k filter and about S5 with 2.4k.
It seems to me that a little less noisy when the trx warm up.
On a dumy load, under 21mhz, no noise, no signal (S0), nothing on the alc bargraph.
On the other side (above 21), I got S3 on the s-meter and a small amout of alc.
With an other trx, I do not have this qrm.

Anyone could help me please ?

73s Mark,
Happy new year..

In fact, it's also noisy below 21.5mhz. All bands are affected and the noise is amplified above 21.5.
Another thing, I lost sensitivity on the low bands.
I made a comparison with another TS450 and the difference is obvious.
For sure my trx has a big problem into the reception circuit.

Do reset of the radio. Then with no antenna hooked up compare the noise levels above and below 21.5 mHz. Both should be S zero.

Do you have the service manual?

Clif

Many thanks for answer Clif.
Reset is done, (A/B + power ON or Clr + Enter + Power ON)
but I'm not lucky.
I still have this noise level without antenna grr.... ((:

yes, I have the manual service.

A reset is A=B and power on. Try that and tell me the S-Meter readings of noise.

Reset, A=B + power on, done

S-meter at S2 or S3

A=B and power on done.

S-Meter is at S3

The TS-450s coverage segment above 21.5 Mhz has it's own pre-amp or RF amp circuit, with somewhat more gain that the lower ranges in order to take advantage of the lower atmospheric noise expected. My 450s has a higher apparent noise floor above 21.5Mhz with no antenna connected.

Perhaps this is what you are seeing with the higher S-meter indication of the noise floor...?

Reset, A=B + power on, done

S-meter at S2 or S3

--- In TS-850_450_690@yahoogroups.com, "avvidclif" <clif@...> wrote:

Thanks to all for your help and advice.

I have changed the RF-UNIT & IF-UNIT, without any success.

Any idea ?

Unplug the Rx antenna input to the RF unit and see if it goes away?

Hi Frank. Yes, looks like we have the same problem. With the PROC.

on, I need to turn the mic gain down to the 10:00 0'clock position. I

tried another mic, and got the same results. Clif, do you or anyone

else have any ideas or suggestions?

KEN, WA5REO

> I find that my radio behaves exactly as you describe when I switch off the PROC, speak in a normal tone at roughly 4 inches from the stock mic. With PROC off I get no movement on the ALC meter and when I switch it on I get full scale deflection. (Or whatever you call FSD on a segmented LED meter. :)

Already tested but still have this hight noise level.

With a antenna connected, I got S5 S7 of noise on 28Mhz
A little bit less on 24mhz, about S5
Below 21.5, I got S2 S3

Tomorrow, I'll swap the PLL unit

Thanks again Cliff for the interest of my problem.

You didn't understand. I'm not talking about the antenna connection on the back of the radio. I referring to the connection on the RF Unit where the RX antenna comes into the RF Unit.

11762. 450 battery replacement

Yahoo group: TS-850_450_690 (2010 — 2016)

Hello all.

Back on the group after a long absence.

I once upon a time had created a geocities webpage on replacing the back up battery in my 450SAT.

Geocities died and the page went with it but now I see it has been archived and is accessible at:

http://www.geocities.ws/lfnca/450bat/450sat_battery.htm

Larry, thanks for that step by step information with pictures. Very valuable. We appreciate it.

I do not think it is a "problem" per se. I've had the unit for 7 year
and as far as I know this is normal operation. However, I may be wrong.
I'll await further comments.

Frank.

11765. TS-850s deaf receiver

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-01-02 03:20:18 UTC
From: noiselessaoldotcom
Topic: 11765 Message: 11765

Hi everybody, happy new year.

I am hoping to get a pointer or two with my TS-850S receiver problem.
Thank you in advance for any help that is offered.

I own two TS-850s's. Rig #2 receiver is deaf, at least 30 dB down from
normal.
During receive, RXB is 7.8v, TXB= 0 volts.

IC1 band decoder outputs are ok. Previously on this rig IC1 pin 2 got
stuck low and caused the 0.5 to 1.6 MHz bandpass filter
to get stuck "on", I clipped the pin 2 to fix the problem as I didn't
have a spare chip and didn't care about that band.
The radio worked fine for months.

Now this receiver has gone deaf again. The SO239 input filer/relay
board is ok, I bypassed it and injected 40 uV signal directly at
CN1 RAT at the RF board input, there's no difference in signal strength
when injecting at s0-239 or CN1.

I sequentially injected the signal (with large value DC blocking cap) at
CN1, then at L3 and L4 (they are easy to get to from the
top of the PCB). I hear the signal at both inductors. But when I move
the injection point to the BPF side of C8, the 0.1 uF sereis coupling
cap, I don't hear the signal anymore.

It seems like there is an AC short at this node but I can't find it. I
would assume that a leaky diode / DC short at this node would cause low
RXB, but RXB is 7.8v (ok). I am using a digital voltmeter, should I
check with a scope? I saw one post that mentioned a bad RXB that looked
like a sawtooth instead of stable level.

D3, D93 and D94 measure ok in circuit with power off using vom diode
checker. I see about 0.75 Volt drop across D3 with the rig on.

With the rig on, At the cathode of D3 I measure 7.1V, this seams a
little high, the service manual page notation shows RX: 6.7v for this
node, the notation is just below the note "D93, D94 VOL. LIMITER on page
121 of the servic manual (RF board)

For the BPF filter switch diode bias circuit, I think it's ok, R5
measures 180 ohms, L5 measures 26 ohms (I assume a lot of tiny wire in
this choke for the high resistance.)

With the radio off, and the RF board out of the chassis, the cathode of
D93 to ground measures about 390 ohms, I am assuming
this OK, looking back through the bias circuit of L5 and R5.

I would greatly appreciate any help

Most likely Q49 on the RF unit has shorted. It should have 12v on the collector in rx.

Ok Cliff, I did understand.
I had changed the complete block (new RF Unit + new frame) => new connection into the RF Unit

Incredible problem. I changed all parts and I can not find why I still have that noise.

You still don't understand. You have changed the RF Unit and IF Unit and still have the noise. If you remove the antenna connector on the RF Unit as I asked you would find out if the noise is coming from there to the SO-239 antenna connector or it is further into the radio.

Hi Clif

Thank you for the very fast reply!

At Q49 I do see about 180 ohms to ground at the base with the junction reverse biased. Should TXB be that low a resistance to ground with power off, or does that mean the base emitter junction and internal resistors are fried? I did confirm txb = 0volts in receive.

I forgot to mention that my previous "fix" to IC1 included replacing a shorted Q49, I have seen that failure before, at the new Q49 I just doubled checked the collector it is high Z with VOM diode test, emitter at GND, C285, the coupling cap to the signal path is not shorted either. R313 is ok at 2.2k ohms.

It is a PITA to measure the collector voltage with power on, looks like I have to fip the board over and insulate from chassis. Do you have any other suggestions before I go there? I guess I could do that, or brute force it and remove everything in shunt with the anode of D3 to isolate, just trying to reduce wear and tear on the PCB in this area.

73

Topic: 11765 Message: 11770

Unplug 3 connectors and the board will flip over and the radio powered up..

Just remove Q49 and see if the rx comes back up. If not it was OK, put it back.

Hey Clif, are you there ?

After severals checking, I found the faulty unit: For sure, That's the IF-Unit.
I was confused with the S-Meter & ALC meter.

With a good IF-Unit and antenna not connected, I got S1 and 3 or 4 bars on the alc-meter
When the antenna is connected, I got S1-S2 and little amount on the alc. All seem to be ok for me, no more noise

With the bad IF-Unit and antenna unpluged, I got S3 and a big amount of alc.
In this case, when I plug the antenna, I got S5-S7 of noise and strong alc.

What I have to do on my bad IF-Unit ?

The ALC meter only operates in transmit mode. The S-meter only operates in receive mode.

Which mode are you in rx or tx?

Clif

11774. Re: [TS-850_450_690] Re: TS450 & strong noise level

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-01-02 19:03:17 UTC
From: Jordan Arndt VE6ZT
Topic: 11748 Message: 11774

I believe is is referring to the VU type readings of the bottom scale for audio on RX.... Personally I think that the IF/RF gain is simply set too high which is increasing the noise floor.

Subject: [TS-850_450_690] Re: TS450 & strong noise level

The ALC meter only operates in transmit mode. The S-meter only operates in receive mode.

Which mode are you in rx or tx?

Clif

My problem is in RX

TX is ok

I apologize Frank. "Problem" was a bad choice of words. I should have

said that my rig operates the same as yours with the PROC on. I really

don't know what is normal or if there is something wrong with it.

I'll wait for more feedback from the group.

Thanks for your reply. KEN

Topic: 11765 Message: 11777

I removed Q49, receive is still bad.

I believe I goofed with my last report I mistakenly put the DC block on the wrong side of my signal injection attenuator, so I loaded down the DC on the net with the attenuator. Ok so I fixed that, I can follow/measure my injected 40 uV from the so-239 all the way to the cathode of D3. I am now going to check at the junction of the cathodes of D33, D35 and D37 next to see if the signal is getting out
of the BPFs. Then I'll check at the outputs of the preamps at the cathodes of D36, D38, and D34.

Since the receiver is deaf on all bands, I am thinking it's unlikely that both the F<22 MHz and F>22 MHz preamps are bad.

11778. getting into the extended functions on the TS-850

Yahoo group: TS-850_450_690 (2010 — 2016)

I have been trying to get into the extended functions on my TS-850. Every website I have found says to do the following:

Pressing SCAN + TX-M.CH will set the radio into its extended function mode

I have tried every combination of pressing the scan and the tx button, the scan and the M.CH button and pressing all three together and all the radio does is start to scan. Obviously, I am not doing something right or all the websites are yanking my chain. I think it is me. Can anyone offer a suggestion on how to really do this? Thank you for any help on this.

Tom, with power off, press SCAN and TX-M.CH buttons both down.
While holding them both down, turn the power switch back on.
Press CLR to exit and return to normal operation.

There is a list of them on pages 35 and 36 of the TS-850 instruction manual. There are 35 functions listed. They include things like turning on and off mode announcement in Morse code; 10 Hz display resolution on/off; displays for 50/144/430 MHz on/off. You'd have to look over the list.

Hi Clif and everybody else

Ok, I traced the RF signal all the way through the bandpass filters and first RF amp with signal injection at the so239 at 7.2 MHz. I see about 13 dB gain through the preamp, looking pretty good. Tonight I noticed that wiggling the what I think is the 8.830 MHz IF out cable, red, labeled at CN29 "RIF", (it goes to RIF on the IF board) caused the receive signal strength to change a little.
When I unplug at the RF unit end of this cable, and touch the center pin to the SHIELD of CN29, the receiver perks up a LOT and I see almost S3. I am thinking the IF is alive on the RF PCB but the conductive path to the connector is bad.

Could a switch diode like D57 have gone bad?
If this unit was used with an external IF device like a panadapter, could a transient have come in through the external IF port and caused some damage? Are there some simple checks to do in this IF to help isolate the bad device?

Thanks in advance

Lee, N1BA

11786. filters/ slope tune

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-01-04 10:40:33 UTC
From: Steve C
Topic: 11786 Message: 11786

I found a post about this issue but can't seem to correct the problem.

I have two Inrad 2.1 filters (one at 8830 and one at 455). The 8830 when selected shows "270", the 455 shows "500". My switches marked #1 and #4 are set to "on", the others are "off".

If I select both these filters, the slope tuning will only work in LSB or USB, not in CW mode. My filters seem to be in the correct places, from what I read in the other post. The switch settings as described in the manual are not clear to me, but I don't understand how they are wrong either. If I put #3 on instead of #4, the "500" lights up on the 8830 side, but I get almost no signals through (no filter there). I believe the filter is in the right place though. Hopefully someone can clear this up. I am supposed to be able to use both of them on CW right?

Here is the other post on this issue:

Hi Clif and everyone

I am reposting as my last post did not seem to appear.
I traced an injected signal at 7.2 MHz from the SO-239 all the way to the output of the preamp at the input terminal of L54/cathode of D38.
I see the signal ok and it is amplified about 13 dB.

I did notice that wiggling the red RIF cable where it plugs into the RF pcb at CN29 causes the signal to vary just a tiny bit.
When I unplug the cable at CN29 and touch the _tip_ of the cable to the shield of the CN29, the receiver perks up and I start seeing S3 or better. RF pickup from this cable when unplugged and attached to a probe wire likewise makes the receiver come alive. I am thinking there is something wrong at the output of the 8. MHz IF, it sounds alive but is not making it to the IF board.

I have never gone this deep into the receiver before, are there some simple checks to make? For instance, what signal level should I expect at C29, and what simple power-on checks should I make in this area?. I used the ohmmeter on the switching diodes in this area and they look ok.

thanks again

Lee, N1BA

From: avvidclif
Topic: 11765 Message: 11788

You're going backwards. Go to pg 190 in the service manual, it is labeled Transmitter section but it is really the rx.

1. Use a probe with .01 cap for isolation. Turn off the AGC and inject a 1kHz audio signal into base Q27 or Pin 2 of IC4. Set the vol control to a comfortable level and hook up a AF Voltmeter to the speaker connection and note the reading. That is your zero setting, do not change the vol control after that.

2. Inject a 455 kHz signal into Pin 7 of IC4 and adjust the level to give your zero reading as found in the above step.

3. The test levels are given in dBu but that's not what you are interested in. The difference in the different levels will be in dB. Using the RF level found in step 2 as a zero point then as you back thru the radio you change the input level on the generator and see if the AF Voltmeter is at zero.

Now that's clear as mud so here is an example. If at Pin7 of IC4 you need an input level of 0dBm to get your AF zero then at the RIF connector CN5 you should need ~-84dBm@8.83mHz. On the level chart CN5 is 12.6dBu and pin & if IC4 is 96.5dBu, the difference being 83.9 dB.

Does that make sense?

In a normal 850 a -81dBm signal(@8.83mHz adjusted to give a 1kHz tone)into CN5 will give an S-9 reading if the s-meter is calibrated correctly. If it does the IF is fine now. Then using the dB differences back thru the RF unit and look for the wrong reading. Follow the chart above the schematic for the injection frequency. It will have to be tweaked slightly to give the 1kHz output tone.

Clif

fip the board over and insulate from chassis. Do you have any other suggestions before I go there? I guess I could do that, or brute force it and remove everything in shunt with the anode of D3 to isolate, just trying to reduce wear and tear on the PCB in this area.

Hi Clif:

Very clear mud, thank you!
It would not be the first time that an EMC engineer was accused of doing something backwards.

Page 190 is gold! I only have the #$%^& black and white pdf that is "wicked Hahd" to read. I probably passed over page 190 because as you say it is labeled "Transmitter". Next time I troubleshoot a Kenwood I will refer to the transmitter section of the service manual when troubleshooting the receiver, and vice versa :-)

Yes I understand the delta dBs between the measurement points, that makes sense and is extremely useful.

I was going to proceed with the last step you recommended, to check my belief that the IF and beyond is fine and to prove that the problem is somewhere on the RF board between the first mixer and the RIF output. Thank you so much for the advice, I think I will have the problem "cornered" soon. I am traveling for work soon so you may not hear back from me for over a week.

73

From: Alan Riley
Topic: 11778 Message: 11790

Glenn, there are some extended functions that are not shown in the instruction manual.

Some info on these functions can be found at:
http://www.db0anf.de/app/bbs/messages/show-22A4DB0RBSC7 and at
http://www.qsl.net/ve7lgp/kenwood/Modifications%20for%20the%20Kenwood%20TS-850.htm
and other places as well.

If a link won’t open by clicking on it, copy it and paste into your browser. The functions at
the bottom of the DB0ANF chart are the ones Tom was referring to.

But, what does the extended functions do?

Hi Clif:

Looks like success! Using your way of working back from the audio stage, I first determined that the IF board was ok. Then I injected at SO239, then looked at TP4 and TP1 and determined nothing was getting out of the 2nd mixer. I injected at TP2 and also saw nothing coming out. I turned the board over and did a good visual and immediately saw the damaged caps. I bet this was caused by roughly reinstalling the "front" edge of the RF board during a previous repair, the underside must have gotten dragged across an edge of the chassis. I'll replace the two parts and hopefully the receiver will come to life.

I uploaded a picture of the problem area, look at the bottom left corner

Finding and understanding the level diagram did the trick!

Thank you for the great help! I will post again with the results of the repair.

11792. No success Re: TS-850s deaf receiver

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-01-06 14:47:26 UTC

Hi Clif et al:

Update again. The caps were NOT broken. there was a piece of small gauge wire insulation stuck between the caps. That's what was in the image. Now I think the 8.8 MHz IF filter selection is not working. I can inject 8.8 MHz at the output of a filter and hear/see S9 signal. If I inject at the input of a filter, I hear nothing regardless of which filter position I choose from the front panel.

I seem to recall that when they were working, one of the 850s's seem to be going dead when changing filter selection from the front panel. I think I power cycle fixed it in the past. If this is the radio that had that symptom, it is now permanent.

Any suggestions on likely failures in the 8.8 MHz filter selection area?

Now that I know the front end of the receiver is healthy, and since the rear panel IF out is ahead of the filters, I am going to check the receiver with my panadapter to see if the IF output BEFORE the filters is healthy. This would have been a good isolation check before.

11793. Question re TS-450S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-01-07 22:08:59 UTC
From: ve1ii
Topic: 11793 Message: 11793

Hello,

A couple of years ago I started to repair my TS-450S after it was damaged by a near lightning strike.
I got a bit discouraged by other events, but now I am returning to the project.
It has been partially dismantled for that time. All of the screws, etc. are still lying on the bench beside the transceiver parts.

Coming from near the back of the antenna tuner are two coaxial cables that connect to the bandpass filter board.
One has a piece of white heat shrink or tape on it near the connector.
They connect to the connectors marked as CN3 (at1) and CN4 (at2)..
question, any advice on which cable goes to which connector? I can trace the paths on the schematics, but it would be nice to not have to take the cover off the antenna tuner and disrupt the wires lying on top of the cover if I don't need to.

Thanks in advance!

Bruce

Hello Rod:

Have you solved finally the problem?.

I have changed the cap, but when I turn the radio on, the RF bargraph goes 9+60 about 10 minutes and finally it returns to his position and it works without problems.

The solution that I use is not to turn off, but I would like to arrange it.

A greeting.
Juan.

Whats the preferred method for long life of a radio, turn it on and leave it on 24/7/365 or turn off and on as needed?

I have had good luck with a Motorola repeater that I put on the air some 15 plus years ago and its still on only with the exception if a power outage. Turn it on and leave it on?

Does this same apply to a Solid State Kenwood?

Hi,
I'm one of those folks. When I purchase a radio, the first place it goes is on the bench where the covers
come off and I open it up as far as frequency coverage is concerned. Then I button it up, put it in place,
make all the connections, and then turn it on, and leave it on. The only time it is shut off is when I leave
on vacation(s). I'm active in Navy Marine Corps MARS, SHARES, and ARES.
I have several radios and scanners, and my two main transceivers are the TS-850 SAT, and the 870.
Love them both. They are real work horses and each, at one time or another, powered a 24/7 VHF/HF packet/pactor Gateway or a full time Pactor Switch.

If you look you will find that the AGC line is on CN1 and makes a turn and goes right by where the leaking cap was. The board wasn't cleaned well enough and some of the electrolyte is still on the board and shorting the AGC line. When the AGC is pulled low the gain goes down and the S-meter reflects this by going full scale.

The white banded cable is plugged into CN3 (AT 1), the front-most plug. See page 84 of the instruction manual.

Thank you Mike! I had never thought to look there for the answer. I didn't have the pleasure of starting out with the rig as a new one and I forgot that some of them came without the tuner and they were often added later.

Lots to learn if I get it working well enough to play with it on the air.

Hi group, recently I bought a headset yahama CM500 and I would like to use it with my TS-450S.
This headset has an electrec element, I know that I can het 8V from rig mic connector.
I cannot find schematics of this headset,
Any ideas how to connect it ???
Thanks in advance

Norm my PS430 has a VR to set the voltage. I set mine all at 13.8 no load. Seldom do I see under 13.68 under load. I doubt that 14 is too high. I used a digital volt meter to check mine, and sometimes I notice they don't all agree.

11805. xggcomms.com rig interface and TS-850

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-01-15 03:05:42 UTC
From: Tom
Topic: 11805 Message: 11805

I just received the interface today. I installed it on my Win7 computer, connected it to the TS-850 fired up the rig and fired up HRD. Initially, the rig saw the interface and I could see the frequency. I started up the DX spot and saw a station I wanted to work. I clicked on it, the frequency display on HRD went blank and I lost communications with HRD. I quadruple checked the settings, played and adjusted the settings and even rebooted the PC. I still get a message saying that HRD is unable to read frequency, make sure the radio is turned on. Anyone have any advice. I've already sent an email to the guy who makes them, I'm just looking for a little extra help.

Hi All

Where would be a good spot in the TS-450 to put a bulb, or back to back diodes in the receiver string to protect it from overload?

I blew out the front end of 2 radios here because of a goof up in a switching arrangement. P:ain to fix! 73 and thanks.

Hi Tom,
While I have an 850, I have not yet tried to run it with HRD. I do have
an 870 and had similar problems
to those that you have mentioned.
My initial problems revolved around getting the correct cable to run from
the radio to the port on the computer. Eventually I got the right cable.
Then it would not read the frequency and gave me a screen
with instructions to be sure that I had the Packet option turned off. I
wound up going into HRD and
setting up the com port according to the 870 manual, then I set the
software to choose its own settings
by sampling every combination of speed choice, and com port available. I
discovered that the battery
in my 870 was shot, and had to replace it as well. When I set the speed
for 192 and one stop bit, it
would not remember the setting and that caused a conflict. Once I had the
right cable, and changed the
battery, I brought up HRD and everything clicked. It took me three tries
going to The Micro Center, to
get the right cable.

From: k4zot
Topic: 11810 Message: 11810

As always, I need to turn to the group for help. I rearranged my wires behind my Ham desk and as usual I always seem to have a problem afterwards. I now have a constant tone on my signal when I transmit SSB that I hear through the monitor feature, but everything else seems perfectly normal. Tuning - OK, output - OK, checked all settings - OK. Disconnect antenna still get the tone. I disconnected the mic and still get a tone. My past issues usually seem to be RF feedback because I am on a second floor with grounding to the AC system and a wire to a rod in the ground. But, I do not hear any distortion on my signal through the monitor. I know it is something simple - but I can not find it.

Any advice would be appreciated.

Thanks,

K4ZOT

Are you using a single point ground? Try that if you aren't. I'm on the second floor and I can move a wire two inches and introduce RF feedback into something. That sounds like what you might have going on. Good luck.

It actually sounds more like 120 Hz power supply hum, especially if it's steady and low frequency. Perhaps a ground loop?

Is it possible that the tone is the whine from a switching power supply being picked up through the adjacent wiring?

From: k4zot
Topic: 11810 Message: 11814

Thanks everyone for your help. I'm using the Kenwood PS-53 PS. I moved a few wires around in back of the radio and the tone is gone. It was a constant high pitch tone - very pure. I just would like to understand what it was.

Can't give you the theory behind it but I've experienced a couple of Icom rigs with built-in switching supplies that did that. I had to sheild the PS wiring on one of my IC-751As because of that problem. I"ve never expenced it with an external power supply but see no reason it could not happen.

The tone is a pure constant high frequency tone. It sounds like a calibration or spot tone.

It actually sounds more like 120 Hz power supply hum, especially if it's steady and low frequency. Perhaps a ground loop?

Are you using a single point ground? Try that if you aren't. I'm on

the second floor and I can move a wire two inches and introduce RF

feedback into something. That sounds like what you might have going

on. Good luck.

Hello Team,

I have a TS-450SAT and the Memory Channel/VFO Change ("M.CH/VFO CH") switch has become intermittent. It sometimes goes up in freq when trying to tune done. Sometimes it does not work at all. And finally it regularly changes frequency by more than 10khz per step. Three questions:

1. It is repairable?

2. Any suggestions on where I can get a replacement?

3. How difficult is it to change?

Thanks very much for the help.

Hi
Has anyone compared a TS850 or TS450 with an Icom 735?

The reason I am asking is to find out if the Kenwoods are working Ok

Both of my kenwoods have YK-88SN 1.8 Kz filters, the RX selectivity seems poor between USB and LSB with a few KCs of splatter. could it be down to filter setup?

My 735 although not as sensitive on RX, is a couple of s points lower, sounds better and has great selectivity with far less splatter

Thanks
Pete

Hi Tom

I had a similar problem with my TS-690 and have had it occurring for a couple of years. Over the Christmas break I decided to have a look at it. I managed to undo the nut holding the "switch" using a small long nose plier without having to take the front panel off. You need to take the top and bottom covers off to be able to flip the face forward to gain access to the "switch" to remove it. I pryed the tabs open on the switch itself and gave the printed contacts a good clean. It is now working as it should and does not skip anymore. You can try some switch cleaner but I have done this on two occasions before and soon it goes back to skipping channels again. Much better to clean it properly with a swab and some alcohol,
Good Luck.

Date: 2013-01-24 23:14:34 UTC
From: Geoffrey Way
Topic: 11825 Message: 11829

If the gears are well away from any major electrical circuits you might try the following, but it could present electrical concerns of shorting if you have critical circuit elements nearby. Use this method sparingly.

Take a big fat carpenter's pencil, and carefully scribble on the gear teeth. Graphite is an excellent dry lubricant, and will last a very long time. But it is also a pretty good conductor.

You might not be hearing the gears so much as the axle bearings, so check out what's going on there, too. A tiny dab of lithium grease applied with a toothpick might be better on bearings. The same caution on conductivity apples.

Whatever you end up using, be sure to run the system back and forth a few times to spread the lubricant out evenly.

Bruce,

Your sidetone is not controlled by the "monitor" button unless the radio has been modified in some way. The sidetone level MIGHT be reduced to nil by adjusting a pot the is on the underside of your radio, and can be changed by use of a slender screwdriver of a small diameter, but a long-ish shaft.

With good lighting, a magnifier, and the right screwdriver, it can be found and adjusted without removing the cover by reaching thru the grating on the underside. Here's an older post with some background:

http://groups.yahoo.com/group/TS-850_450_690/message/1748

11831. Intermittent/High SWR on TS-540S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-01-26 00:07:21 UTC
From: Donald
Topic: 11831 Message: 11831

My TS-450S started behaving stangely recently. The SWR seems to be jumping around. Today, for instance, I put it in CW mode and tuned the output using my antenna tuner so that the SWR was 1:1 (14.070MHz). I then switched it to USB so I could run PSK31. The SWR immediately went off the scale. I switched back to CW mode and it was 1:1. When in USB mode it went back to high SWR. This does not happen all the time. Sometimes in USB mode it is OK, but most often it is not.

Any ideas as to what would cause this?

Don

Hi Don

It may sound silly, but are you sure you weren't in split mode?

I've done that before on my '450 and end up transmitting on a different band

Topic: 11834 Message: 11834

Hi Group,

Experiencing power tail off on frequencies above around 14Mhz.
1.8, 3.5, 7 Mhz all fine 100W o/p
As one tunes the dial up, the power/car drops to near enough 0W at 29Mhz.
Easy things checked: Impedance of dummy load, DSP-100 disconnected, Menu reset, checked most coaxial interconnecting leads on CAR boards etc.

Swapped the RF board (with a known good one) out in case it was the switching 74LS145IC had stopped functioning, no change.

Upon close inspection, all looks, smells and feels fine. The only thing that I do note is that D16 (Protective fuse on ant I/P) looks a bit discoloured compared to another 850 that I have hear.

Reluctant to start desoldering this if it is not the cause, and wondered oif any of you good folk may know of anything that I have missed.

Regards,
Terry G0VHS

Try running it into a dummy load going straight through without the tuner and see if it still happens. If not, then run it into the dummy load with the tuner and see if it happens. If not, then it could be your feedline/antenna.

73,

Tom AF8P

Hi re TS 690. Are you trying ENTER as a direct freq input if so you must put in 00.0050 and then it should come up its all done with those zeros or do this go beyond 28.999 and the next click will get 50.000 use the up/down buttons and then the small 1-5-10 tuning step knob, sorry not very tech but I hope you get what I am saying - I am only a M class op. Mike.

11837. newbie with questions

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-01-26 11:18:46 UTC
From: Ron
Topic: 11837 Message: 11837

Hi all,

I just purchased a nice looking TS-450Sat and have been reading the user and service manuals for a week now but still have some questions left.

The enter button seems not to be working and maybe there were some issues with it in the past but can not find info on the group. The audio quality in transmit is not very good as it has a narrow BW and more of a nasal tone to it. I suspect the radio needs an alignment for this. The mic level adjustment with is very critical and the radio makes only 50 Watts at maximun ALC allowed scale deflection. This is all done with the standard fist microphone and without processor activated. With pocessor on I get 60 Watts maximum output. My TS-480Sat gives me real 100 Watts with the same microphone and a better audio so I guess as a wrote before a good tuning seems needed.

I also like to pick-up a useable IF-out to feed a SDR so I can have a spectrum readout or get better signal detection. I like to use the TS-450 for digital mode operation. Does someone know where in the (RF board I can extract a decent IF signal? The 8.83 Mhz signal just after D39 seems to be possibility. I have seen the TS-850 has an IF-out on the back panel, but the TS-450 does not have this option.

Where is the Car Control set. It's normal to have to use more drive on the higher frequencies.

Unless your radio has been modified the Car Control will have no effect on SSB operation. The Power Control adjusts the power out in both CW and SSB. The Car Control adjusts the drive in CW, FM, etc modes.

Put the radio in CW mode and adjust the Power control to max. Start on 80m and adjust the Car control for full scale ALC. Then step up thru the bands and see if you can get full scale ALC reading on all bands by adjusting the Car Control.

Fully clockwise!
The control behaves proportionally as it should, only as the freq increases, the o/p drops.

One last question, What does the current drawn by the radio do when the power goes down. If it goes down then there is a lack of drive. If it goes up a relay in the filter unit could be stuck.

The radio draws 19 A @ 7 MHz - 100w
13A@18MHz 30w
4A @ 28MHz negligible RF out.

I have changed X51-3100-00 with another known good PCB. I believe I called this the RF board when in actual fact it's the filter/relay PCB. All relays activate upon band change with the exception of 18-21MHz and 28-29MHz change. I assume they share the same LCD ccts.

Interestingly there is NO attenuation of received sig gen carrier at any frequency - all appears fine in RX.

Now that you have clarified the board you changed and it wasn't the RF Unit you have a shorted diode(s) on the RF Unit bandpass filters. Check the pins on the 74ls145 to determine which one(s). It also could be the 74ls145 itself.

Thanks Clif,

That was my first port of call; changing the board with a known good one, which unfortunately had no effect.
I read that these BCD drivers are the weak link.

Voltages check out as I would expect, and are in sympathy with a good rig.

My thoughts are turning to further up the line or this discoloured surge diode, although I do not understand why the power tails off so gently. I guessed if the diode had gone o/c then there would be no RX?

Regards,
Terry Simons
G0VHS

Your Welcome re 6m input, let me know if that works also note the other so259 on the back for txing on 6, its all done by zeros. Mike.

On the RF Unit, X44-3120 (bottom left board). Locate IC1, 74LS145.
Put the radio on 20m and measure the voltage on each pin. What is it?

What is the SWR reading on each band as you go up in frequency?

Clif

11850. Selling my beloved 850SAT

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-01-28 02:15:48 UTC
From: nm9p
Topic: 11850 Message: 11850

Alas, it has been a great love affair since 1993, but my trusty one-owner 850SAT has to go to make room for a new FLEX-1500 that I got for Christmas and a FLEX-6500 that is on the way (as soon as they ship).

It is serial number 50 Million series and has the 250 Hz 8.83 Mhz IF CW Filter and the 500 Hz 455 Khz CW Filter. (I don't remember the part numbers right now.)

Here is my question for those of you who have sold or purchased these units used lately: Would I be better off separating the CW filters and selling them separately or trying to get a good price out of the rig all together?

I have never posted anything on Ebay before, so I may try other venues before it goes on Ebay.

Wish me luck.

Ken - NM9P

I have same problem with a TS450SAT. I guess I will sell separate the AT and each filter. probably 100USD each, but no one would pay 300USD extra for the radio with extras

I guess you get more money selling separate.

I bought so the 1.8kHz SSB filter.

Hi all

I have a TS850 and if I look to the figures of the display then is see incompleet letters.
I have had the radio for repair, The repair folks say it is not in the leds it self and not in the c's or ic's on the board but in the glass of the dsiplay. This should have lines and the are gone...?
Have you ever heard of that? I can now buy a front from a TS850 with the glass plate. Will that solve the problem?

Tanks for your time.

Timon I replaced that whole board one time on an 850s. That cured the problem, but like all older radios I soon had something else pop up. As long as there are parts out there from a donor radio you can keep them going. They are an excellent radio. I just resurrected a TS450sat and it is a fine radio. It took a board from a donor radio to do it though.

Topic: 11831 Message: 11861

I have had a similar problem with a FT-ONE. The toroid that measures SWR and power was glued with some yellow compound that become brown and conductive where it touched the central conductor of the toroid. So some power was passing by conduction instead of by induction to the SWR meter, causing the radio to cut sharp any power out. I had to rewind the toroid.

I have uploaded some photos about it.

In other case with a Butternut antenna 30 years old, the central fiberglass isolator had beed damaged by sunshine, losing capability to isolate. With low power up to a few Watt it was OK, but when over 20W become conductive and SWR went up. This only happened in the low bands. 20, 15 and 10m were OK as in these bands the fiberglass isolator is not online.

I have a used 450 that I bought several years ago. The antenna tuner was working before. I don't use it often. But now when I try on any band, it times out. I tried it on a new antenna, that is ready to go up, and same results. Is this indicating that there is a problem with the radio/auto-tuner?

Thanks, Steve

Try it into a dummy load. An antenna that's not up could have an SWR/impedance that is too far off for an auto tuner to tune. Just a thought.Bob WE6C

Make sure that you have enough drive power so that the ATU can resolve any mismatch.
If the power level is too low, the tuner will 'hunt' and time out eventually.

11867. TS-450S AUTO TUNER malfunction

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-02-01 11:57:57 UTC
From: Jose V. Gavila
Topic: 11867 Message: 11867

Hi all,

I am dealing with a TS-450 which does not properly works in AUTO TUNE mode. What happens is curious at least: when you press the AUTO/THRU button, AT TUNE lights and tuner motors begin to move. But the rig is not switched to TX!. So, of course, tuning does not work.

I have checked internal menu options and are OK.

I wonder if someone has had a similar problem.

Thanks for your help!

Regards,

JOSE

> KF6OZ

No, that is not the case. The rig is NOT on TX, but remains on RX while AT TUNE is lighted and trying to tune (but it is on RX!), so this is a hardware problem.

It's working properly. When the Auto Thru button is pushed it goes back to the last setting on that band, no matter where you are on the band now. It may have stored bad data which keeps it from going back. I would reset the processor which clears all the AT band data.

> I would reset the processor which clears all the AT band data.

I know you are an expert on these rigs but, trust me, it is NOT working properly :-). I think I have not explained it clearly enough. Let's try again:

Even after a RESET, if you press AUTO, it NEVER gets on TX. Never. It keeps moving up and down the motors for a while and then stops. But, as there is no transmission, it is of course not properly tuned.

I understand the tuner memory question you comment, but this is not the case.

I have read the Service Manual description of the AT UNIT operation and I think the cause could be that the system is not able to read properly the VC101 and VC102 positions, as it states (page 27) that "If variable capacitors VC101 and VC102 are not at their preset positions, they are set to these positions, and AT TUNE operation and actual transmision start after the presetting ends". So the key for me is on that sentence. I would say that the unit hunts for the presetting positions but something is not working OK on the position feedback.

BTW, I have a TS-450AT which works properly, so I know this one is acting up :-)

Regards,

JOSE

Hi again,

Clif, don't kill me, please... I have taken my 'good' TS-450 from storage... and it does not work as I thought it did :-O

I was confused with the TS-850 and, yes, had not noticed the sepparate (on the keypad) AT TUNE key :-D and expected only the AUTO / THRU button did everything.

I am sorry!. I have too many rigs and work on even more. I hope that serves as an excuse ;-)

Best regards and sorry for the wasted bandwidth...

Regards,

JOSE

From: Jose V. Gavila
Topic: 11867 Message: 11873

Hi again,

This time I have a _real_ problem ;-)

Yes, if I press the AUTO/THRU button, unit gets back to the last settings. But that process takes, sometimes, too much time. Motors are going up and down for several seconds (up to about 20 or so). Finally, AT TUNE lights off and then I can press AT TUNE button to find a new auto-tune position.

I have checked on both units, mine and the one I am working on, and the time is lots shorter on my unit than on the other one. So it seems there is some problem for the unit in reading the positioning pots for the variable caps. I will check the signals with the oscilloscope.

Well, all in all, there IS a fault ;-), even if the first one was operator's error :-D

Regards,

JOSE

And, to end this saga, the culprits are the positioning pots... as someone decided they would work better IF FULL OF OIL :-(!!!

They, as all the tuner assemply, have plenty of oil all around.

I have cleaned externally and then sprayed them with contact cleaner and now they work lots better, even if not as fine as my unit.

I hope this could help to other people in the future!

And, remember, DON'T use oil IN the pots nor on the nylon gears.

Best regards,

JOSE

If there was other data loss it could be the battery but for the battery to cause bad tuner data on a consistent basis, I doubt it.

Jose, I had a 940 that someone had floated the tuner in motor oil I think. I couldn't figure out why one time it would work and not the next until I broke down and opened it up. Amazing what a good cleaning will do.

Yes, it has been my same experience with this unit. Once I put enough cleaner to dissolve the oil inside the pots, it takes just from 0 to about 3 seconds maximum to reach the preset position.

I checked before and even made a video, which was stopped after more than 40 seconds of tuner hunting for preset position on 18MHz!

Thanks again for your help!

Regards,

JOSE

I have my CAR control set at about 6 and my PWR at full clockwise. I
don't think I've even touched those controls in years.

11892. Higher bands problem on TS850s

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-02-03 18:06:37 UTC
From: Patrick EGLOFF
Topic: 11892 Message: 11892

Hi all,

One of my two TS850s has an intermittent problem on the higher bands. It started on 28 MHz and now happens sometimes on 24 MHz also.
On receive and transmit i have what can be called a "raspy sound", particularly on strong signals. The other bands are fine.

Some times ago, i've changed the variable capacitor on VCO2 of the PLL board. So that must be OK.
All voltages i have checked were all OK when i did that.

I don't have the frequency relationship, but i suppose that it has something to do with the VCO1-D on PLL unit...

Is there a "common" problem know around this ? has anyone already cured this problem ?

Thanks for any help.

Aha! Thanks, Clif! I had been going through the manual and on an earlier page ()23), it stated that the initial setting for all four of those knobs should be counterclockwise. That's how I kind of shot myself in the foot! :-)

Thanks, Steve

11896. DDS chips for the thousandth time

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-02-04 20:39:15 UTC
From: k4pdm
Topic: 11896 Message: 11896

I hope I'm not being a pain but I need a little help here.

I am considering the purchase of a third TS-850. This one I'd like to keep. Put all the filters in, get the matching speaker. I have an Icom IC-761 that looks good and works great, but it's not as good as the 850s I've had.

I'm looking at an 850 in the 305XXXXX range. I suppose it will surely have the older, failure-prone DDS chips?

I'm sure there are unobtainable parts in my old Icom but parts rigs are common. Parts rigs for the Kenwoods with the needed DDS chips seem to be extremely rare.

If the capacitors are good and everything checks OK, how big a chance am I taking with the Kenwood, really? Opinions? Clif? Anyone?

They may have been replaced. Only way to know for sure is to look. Otherwise almost 100% certain the old caps.

Hi Clif,

> Errruh, not caps, chips, IC's as in DDS...
>
> Clif

Well, as you know, on that board THERE ARE old caps... and they generate LOTS of troubles!. So you were right ;-)

Some samples can be seen on this page of my WEB:

http://jvgavila.com/wb7.htm#sec3

I have seen very bad damaged DDS boards on 3xxxxxx series but also some on newer ones. But, even if not seriously damaged (yet), ALL TS-850s I have seen so far (about 30 or so) had some kind of leakage problem on CAR UNIT. My own TS-850 needed care regarding leaking caps.

And, regarding donor units, the TS-450 has two identical DDSs on it... so it is another useful source.

Regards,

JOSE

From: Alan Riley
Topic: 11896 Message: 11900

My 306XXXXX one (bought new) has the old DDS chips but they haven’t failed. I have had to replace the carrier board electrolytics (along with several on other boards).

My 506XXXXX one (bought used) has the new chips and I have never had to replace any chips or
electrolytic caps in it. I did have to replace the PLL board in it with a spare board a couple of days
ago after getting a raspy audio problem. Now I need to replace the trimmers caps in it’s original PLL.

If the one you are considering has not yet had the carrier board caps replaced, then it’s living on
borrowed time and would be the first thing I would do to it, along with replacing the battery.

73,
Alan, KD5R

Look below the SMD electrolytic capacitors. You may have some 10 to 20 of them leaking and dry. It happens in most of the electronic things of that vintage. Bad years for SMD capacitors

In other equipment (not radio, Pro-sound) I have found that ALL (and that means MANY) the 10uF/16V were bad. That is an special bad value in that vintage.

The good thing of it is that usually they can be substituted by conventional capacitors, there is lots or room. Something impossible in modern radios.

I recommend you have a look... tracks can be damaged by the leakage. In Ebay you can buy full sets of capacitors.

The question is not IF they fail, but WHEN they fail.

Hi All,

This was not my problem...
I've changed these caps some times ago.

After a careful check and some tests, it is (at least i hope it was) the ajustable capacitor in the VCO which is causing the problem. The test voltage at TP1 changed from last check and i could see it changing with time.

I've changed it against a small one i had in my junk box... Now the voltage at TP1 is stable over night...

I now need to order a better replacement than my test cap !

73, Patrick.

Take a look at page 79 of the instruction manual, Pete. I think VR13 is what you want, but I haven't ever adjusted mine, so I'm not 100% sure on that...

11908. The free Kenwood RTX service manual for old rigs

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-02-12 16:43:07 UTC
From: serracin7388
Topic: 11908 Message: 11908

For new members and others who may have missed this. From time to time I make a reminder !

We have discovered a free Kenwood service manual for various old rigs. Some people have found it more useful than a rig service manual itself !

You can download it here:

http://www.jvgavila.com/man_ham/rtx/rtx_manual_index.htm

Enjoy,

Paul

Thanks for the info Mike

The problem seems to be with the actual mic gain itself. When its on min the alc reading is still high when using phone. I can work data modes with the gain nearly off and use tx adjustment on the signalink. Im not sure what to try next, maybe the mic gain VR pot? With your help at least I know that VR13 is for ACC2

Is the ALC meter set correctly? It doesn't sound like it. Go to CW mode and slowly bring up the Car. At the point the power out stops going up the ALC meter should just start moving. It should then increase slowly without any additional increase in power out. If it moves before the power stops or jumps up rapidly it's not set correctly.

I asked this question some weeks ago and was told Look in your handbook
which I did not have so I went and did a google, yes getting the ALC up to a power out re watts seems to depend on that CW mode, I thank you for YOUR posting. Mike M3EMB

11918. TS-850 automatic tuner failure

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-02-16 15:51:46 UTC
From: joe
Topic: 11918 Message: 11918

HI,
some threads here, but no finally solution
Today I did a video of the failure
http://www.youtube.com/watch?v=VBLMRxoHh-E&feature=youtu.be

The problem is in automatic mode the tuner do not stop automatic after finding low SWR.
And CAR is fully clockwise.
In manual mode it works fine
any ideas
73 Joe

Well I just completed the 50.0 mhz antenna for my 690s,
when I use the key pad to input the frequency of 00050.0 mhz that works fine but I can't get it to transmit on any mode??
what is the exact procedure for using the 6 meter band with the 690s.
I have looked in the 690s manual there is no mention of the operational procedures in mine anyway. Help

There are not any differences in using 6M compared to any other band on the 690. Just select your operating mode and tune up as usual.

Do you have a dummy load you can use to check operation? Always good to rule out the obvious.....a bad antenna.

Good luck and 73,

Tom - AF8P

Michael,
ok I have posted the directions in the photo section (wards radios)to build a 6 meter antenna mine however is a little different as I used 3/4"to 1/2" aluminum tubing and 1/8" solid stainless steel rod.

I used a spring pin to couple the 3/4 to the 1/2" tubing and a reducer with set screws to hold the 1/8 " ss rod so I could adjust it but as my antenna mfj analyzer says its perfect as it is. 56" each side. this is set for the lower end 50.1 mhz w/o a tuner.

the 3/4 is 1 ft x2
the 1/2 is 36" x 2
the 1/8" completes the 56" each side.

or you could just use copper wire that is 56" each side hooked to some plexi glass with a so259 as I did on this one.

happy 6 metering hope to here from you on 6 meters when the season open up kf6pjw. good luck Captain Leeward "never give up the ship"

Hi Cap. Have not looked yet at your 6m antenna but I will, I have lots of bits of tubing here LONG - SHORT reused plus some solid rods, I have used this tubing over and over again as my hobbys have changed, some tubing was at first Band 1 or 3 TV antennas, I reused them by pop riverting the bits together these being held in place by put a smiller bit of tubing inside the larger one, I have 5 tube cutters and a tube bender, making something out of scrap tubing is a job I like. Michael.

Hi Cap. Well I made the 6m dipole today I had some plaxi glass and a few 1 inch U bolts in fact all the bits my tube cutter only likes thin walked tubing so in the end the weak cutters made the cutting points groves and out came a hand saw, took about 2 hours to make. I moved a 20 foot pole today as well, from the top end of my garden to a point closer to my radio rooms window, in my morning I will bolt a
T £ K bracket set to the wall and put the start of my sky tubing in the air with a rotator. In your photo you have the 6m in the middle!! and a 10m dipole as a active reflector but what is in front something for 2m could not fully see and I maybe totaly wrong. Mike. M3EMB Uk.

Hi Mike, those pictures are of two different antennas one is a 6 meter it has one element with two halfs.

The other is a 10 meter broad band yagi which is

2 driven elements
1 director element

this allows me not to have to re-tune the antenna
as I go up frequency. 50.1 thru 54.0 so its really a 2 element yagi.

In the backyard where my antennas are is a small vally and I'm at the bottom with only east and west to use.

Hope I have answered your question. Cap don't give up the ship.

Hi All

I got several responses to my question about my mic gain control having to be all the way up to get audio out and proper ALC. Message
#11738.
I ask now if maybe VR13 was adjusted by the previous owner. I can not
contact him to find out. Am I correct in assuming, from some of the latest post, that the TX audio could have been turned down by VR 13 if used for data transmission?
I am a bit reluctant to start adjusting any factory settings until I know what I'm doing.
Any feedback will be appreciated.
Thanks Ken,

VR13 adjusts the level from the Packet in only. It doesn't adjust the mic gain.

11937. VS-1 on Kenwood TS-450?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-02-19 13:55:48 UTC
From: lu8eq
Topic: 11937 Message: 11937

Hello,

I have a friend who is sight impaired and who just bought a TS-450. He already had a TS-440 with the VS-1 voice synth. board. He has a spare VS-1 and some told him that it could be rewired for the TS-450.

I looked at the VS-1 & VS-2 schematics and I could not figure it out. They use the same main IC, but they are not pin compatible with each other.

Could it be possible to use a VS-1 on a TS-450?

Thank you in advance for your kind comments.

Guido, the manual states VS-2 voice synthesizer. I doubt that it would be worth the trouble to try to rewire one.

I don't know if the TS-450 has a separate processor adjustment and metering like my TS-850 does. But if not, it may operate as my old Icom IC-745 did...
In Processor OFF mode, the mike gain works as you would expect.
In Processor ON mode, the rig internally adjusted the gain so that it stayed properly within the right ALC range, and the "Mike Gain" controlled the amount of processing/compression. One of the experts on the 450 can address this.

The best way to tell if it is working properly is to listen to your signal on another receiver with headphones while transmitting. Or you can listen to the built in monitor (if the 450 has one) and get some indication of your signal quality. Be careful. A little processing goes a LONG way, and many hams use WAY too much! So much so that it starts to sound like Channel 19 out there!

Thanks guys.I thought I was on the right track after reading the responses for message # 11906. I don't run the processor. I am just told I can't be heard unless mic gain is turned all the way up and speaking a little louderthan normal into the mic. I am told my audio is "KENWOOD QUALITY'. HI. I have tried both, an MC 60 and the MC 43.I guess I will do a little more research. I really don't want to ship this rig, but as a last resort, I will. There is a real good tech in this group that was recommended by the Traders Net. Thanks To All, KEN WA5REO

Hi Tom;

I wish my 450s was working good.
I think I ran everybody off because I keep asking about my TS 450S
mic gain control position. HI HI

I have had this rig only a few months. Before that I ran the FT101E.
I have the complete Yaesu station setup except for the 2&6 meter transverters. Soon I will post a picture on QRZ

What rig are you running?

Put both 8.83 and 455 filters on 2.7k so you are only listening to LSB and then you will be fine.

Fellow TS-850SAT Owners,
I just joined this group. What a wealth of information on this fine transceiver. I've had my 850 since the late 90s and decided to finally try CAT control. I bought a CAT-USB cable from Steve at www.xggcomms.com. The communications link has not been reliable. When first bringing up the logging software the comm link works fine for a few minutes and then hangs. I need to restart the computer and radio to re-establish the connection. I took apart the cable and did a loopback test using a terminal emulator on my computer. That worked 100%. I tried three logging programs and they showed the same symptoms. So it appears to be a marginal timing issue or something on the 850. Can anyone help me?
Thanks,
Jim

I had the same issue the with xggcomms cable. I am in the process of sending it back. I did the same things; did the loopback test, checked the quiescent voltages at the acc port and tried different programs. I prefer to use HRD 5. Yadda yadda. I, too, am hoping someone has a working solution not involving the xggcomms cable.

I don't know if this will help I have a 450 and I know that the audio out will differ when using a dynamic mic MC60 with the processor disabled or enabled. Then again the MC60 A (amplifier) mic will sound different when in the amplified mode verses unamplified. The processor enabled changes the audio. I use to run the processor enabled and the mic in dynamic mode but I later learnt by asking friends what was better and I decided processor disabled and mic in amplified mode. To determine final mic gain setting I asked friends on the air to tell me when I reached the max. level before distortion. I know elementary.

11956. TS-850: Bencher Paddle - need to tune with "key down"

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-02-27 00:40:24 UTC
From: k4zot
Topic: 11956 Message: 11956

I am sure their is a simple answer to my question. I have a Bencher paddle which has to be set up on the 850 by switching on "electronic keyer" on the rear of the 850. But, when I do this I lose my ability to "hold the key down" to tune my Amp. How do I key my 850 to tune my Amp with the paddle?

Thanks,

Glenn

11957. Re: [TS-850_450_690] TS-850: Bencher Paddle - need to tune with "key down"

Yahoo group: TS-850_450_690 (2010 — 2016)

From: Bob Naylor
Topic: 11956 Message: 11957

This has been a common complaint among 850 users.I do one of three things.
1. Get use to reaching around the back and finding the switch and turning off the electronic keyer.
2. Use the "tune" button. Not for the auto tuner, the other tune button. You will get 50 or 60 watts out when keying the mic. The "carrier" adjustment will adjust it down in power from there but you cannot get the full 100 watts out this way.
3. If you use an output meter to tune your amp, set the key speed to 60 WPM or so and key it and watch your output meter as you tune. This is very effective. Do not use QSK tho!
Let us know.

There may be an easier way, but this mod allows you to key it directly
while you have paddle in use: http://zievid.com/W6OT/TS-850/TS-850.htm

Thanks for reply John. I must ask where is the mic gain control setting at when you are using the MC 60 unamplified and proc off?
I have the proc off and using an MC 60 unamplified mic, the mic gain control needs to be all the way up and speak a little louder than normal into the mic. Under these conditions, the ALC is normal and the audio, I am told, sounds good. I just think that something is wrong or something is getting ready to go out that requires the audio gain control to be set at max.

Thanks Again, KEN WA5REO

From: Tom Osborne
Topic: 11956 Message: 11960

What I do here with my '450 is put it in the FSK mode, hit 'send' and that sends out a carrier.

I'd think the '850 should have a FSK mode? 73
Tom W7WHY

I am sure their is a simple answer to my question. I have a Bencher paddle which has to be set up on the 850 by switching on "electronic keyer" on the rear of the 850. But, when I do this I lose my ability to "hold the key down" to tune my Amp. How do I key my 850 to tune my Amp with the paddle?

Thanks,

11961. Re: [TS-850_450_690] TS-850: Bencher Paddle - need to tune with "key down"

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-02-27 03:15:56 UTC
From: Mel Cruts
Topic: 11956 Message: 11961

Hi,

Easy one...
1. Have controls set-up so that display reads WATTS output and SWR.
2. back off to aproximately 11 o'clock on the CAR control.
3. depress the combination "tune & 8" key on the frequency entry keypad
on the 850 front panel...the TUNE indicator will come on.
4. depress push to talk on either the microphone or REC/SEND button on
front panel...rig goes into transmit mode.
5. adjust the CAR control so that you get proper drive to tune your amp.
This procedure is also appropriate for tuning up an external tuner.
6. when finished release the transceiver from xmit mode by releasing the
PTT or REC/SEND button.
7. when linear/antenna tuner adjustment is complete return the CAR
control to it's normal operating position
8. to assure your 850 is tuned properly for the linear input impedance,
enable the THRU/AUTO button to enable the automatic tuner.
9. depress the AT TUNE button once to let the auto-tuner match the
linear amp input impedance for optimum performance.
It should complete the tune-up in a second or less.

I believe the 850 puts out this tune-up carrier on the indicated
operating frequency (zero beat) so it don't interfere with communication
on the channel
when you are in USB/LSB mode by giving everyone the tuner-upper blues
from listening to your high power carrier. The tune-up procedure on
many
Kenwoods from TS-840, TS-850, TS-870, TS-480 and TS-590 is approximately
the same.

73,
Mel - KF6OZ

What I do here with my '450 is put it in the FSK mode, hit 'send' and that

sends out a carrier.

I'd think the '850 should have a FSK mode? 73

Tom W7WHY

I am sure their is a simple answer to my question. I have a Bencher paddle

which has to be set up on the 850 by switching on "electronic keyer" on the

rear of the 850. But, when I do this I lose my ability to "hold the key

down" to tune my Amp. How do I key my 850 to tune my Amp with the paddle?

Thanks,

Glenn

Tom - your suggestion works great and is the simple - just turn on your FSK to tune-up. Is there any draw-back to using this technique while tuning my Yaesu FL-2100B Amp.

Thanks,

Glenn

Should be no problem.

You can vary the amount of power with your 'PWR' control on the '850 to turn
it down when tuning up. 73

HI GUYS
 GOT A QUESTION I HAVE A KW 850 WHE I TUR IT ON IT SCANS TO 30.000.00 AND STOPS ? I CAN DO A COMPLETE RESET AND IT STARTS ALL OVER AGN STARTS AT 14.000.00 GOES TO 30.000.00 CANT CHANGE ANYTHING ON IT IT DOES KEY UP VOLUME WORKS BUT JUST HAD NEW FINALS NEW BATTERY CHANGED A FEW CAPS AND ALINED AND WORK WAS DONE BY CLIF AVVID ABT A YEAR AGO . I USED IT FOR A MONTH OR SO AND GOT A NEW RADIO AND SET THIS OHE ON THE SELF ABOUT 7 TO 8 MONTHS SO THE RTTY COTEST WAS COMING UP AND I LOVE THIS RIG ON RTTY . DONT TAKE ME WRONG IT WORKED GREAT WHEN I GOT IT BACK FROM CLIF I MAY SEND IT BACK TO CLIF BUT IF THERE IS SOMETHING I CAN DO ILL TRY ??? FIRST OR I MY JUST SELL IT OR TRADE FOR ANOTHER RIG ???? BUT I HAVE CHECKED THE SCAN BUTTON I DONT THINK IT IS STUCK I CHECKED THE MIC AND TRYED A DIFFERENT MIC ? THERE IS NOTHINK ELES HOOKED UP TO THE RIG .

I had your problem on my TS-850, the defect was: did the reset to 14.0000 MHz, the radio occasionally slipping as if it were scanning up to 30.mhz then crashed after a while you occasionally blocked or locked Remained until some component is heated and returned to normal operation.
The solution after months of detention in two service centers kenwood was the replacement of the entire board "x46-308-a6 digital unit", probably 15 years ago you could not technically unsolder the offending component for this defect with modest desoldering equipment, it is Certain That 99% of That defect in my case was on That card That I Mentioned: Digital unit
x46-308x-xx-(page 131 service manual) can 'Also to be cold welding. Good luck for the record That card costs about 80 euro on the used market for spare parts.

JR, its been a long while since I have had a TS850s, but they are a fine radio. Wish I had mine back.

Are there upper and lower scan limits that are programmable. I don't have a manual to check this out, but if you can research your manual see what it says about scan start and stop places.

Topic: 11970 Message: 11970

Hello

I plan to buy a TS-850, unfortunatelly both offers are serials starting with 03xxx and I'm not sure it is the best solution for me. I work mostly CW interested in DX and sometime contests. Other choice will be TS-870. I just sold an FT-920 because of loud QSK and audio "pops" when on CW.

How is the 850 on full bk-in?

I also use FT-950/FT-2000, IC-756 pro II, III but what I observed is a degradation of Signal/Noise factor when narrow the bandwidth of the IF Dsp. Lower bandwidth=more noise. Only exception tested are Orion 565 and K3 but these are outside my price range.

Is it 870 a better solution or 850 (quite old now) is doing good also? On 850 I?m afraid of the bad capacitors and problems derived from this issue.

Any advice will be appreciated!

Hi Adi
Both radios are great. I purchased an 850 back in 1994, and ran it for over a decade as a
Navy MARS PACTOR BBS 24/7/365 and never had a lick of trouble. I purchased an 870 when
they first came out and it has been my primary radio at my other (now permanent) QTH.
As I understand it, the 850 parts are becoming scarce, but the 870 parts are still available.

11977. '850 speaker

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-03-03 20:53:10 UTC
From: w9jlk
Topic: 11977 Message: 11977

Is there a Kenwood speaker that matches the 850 in height and color other than the sp 31? I would like to have a matching speaker but I don't need the audio filtering, etc. tnx/73

Hi..was just monitoring the TS-440S group and see an internal DSP unit available from W4RT for the TS-440S.

Anyone have information as to whether this can be installed in an 850 ?

tnx

It shouldn't be a problem at all. Put it in before the vol pot.

Topic: 11977 Message: 11980

I don't think so. The audio filtering is nice in my opinion. I make good use of it. Have you tried one? Another nice thing about them is you can use them with two radios. I run my TS-590S next to whatever other Kenwood seems to please me for the appropriate week or month (TS-450S right now) and it is nice to be able to switch the speaker between the two radios. Just my two cents.

Regards,

Steve, N4JQQ

Topic: 11283 Message: 11981

Hi all,

Anybody have any hints on how to remove the security screws holding in the digital board without risking damage to the board?

I need to replace the battery and recap the board.

J

From: rzacharkow
Topic: 11202 Message: 11983

Gonna ask maybe a crazy question:
Am the original owner (1993) of a TS-450SAT: powered by an Astron RS-35M, years ago put in the TU-8 tone unit, have the YK_88SN-1, YK-88CN-1, (also have the YK-88C-1), and the YG-455C-1 filters. Use the stock MC-432S mike, and the PS-23 external speaker. Use a MFJ-490 memory keyer. My ant is a G5RV up about 33 feet. No amp. Into CW.

Yes, this stuff is 20 yrs old. How hamstrung am I by staying with this rig??? (rather that upgrading to a 590) (I am not a contester...just a basic rag chew guy).

Been driving myself nuts over wondering.

Thanks in advance.

Rick

HI Rick

Got 2 of the '450's here and I love 'em. I also have a FT-450 and it's not near the radio the Kenwoods are.

New radios are always fun, and you can't have too many of them. 73

Maybe they were a service tech addition, after the rig was attacked a Golden Screwdriver? Of course, they would be more effective if installed in the outer cabinet instead. ;-)

I have a TS-450 and really like it. Have used it in the fairly busy bands on FD and find it very capable.
I got an FT-950 a few months ago and enjoy messing with the features. It has some effective capabilities, but the real difference is minimal.
If you have both 500Hz filters and know how to use everything, there's no real need for another radio.
I'm not sure the new Kenwoods are better, since I have heard mixed reviews.
What's for sure is that just part of the cost of something new put into 30' of used tower and a tribander will do more for you than any radio!
There are still people around who can repair the TS-450, so you should get to know Clif and anyone local you can locate and check out.
Shipping is brutal, but still a lot less than new gear.
It might even be worthwhile to have the trouble spots taken care of before they show up, if you want to keep the radio.
Sooner or later we'll run out of parts, but there are quite a few junkers still around.
If you spend your time learning some technical stuff and developing skills, instead of reading ads, you'll feel better!
The Antenna Book and old Handbooks are your best friends!

Possible, but unlikely from what i know of the prior owner.

I bought the radio from a deceased estate, and the home made kit included some of the best made gear i have ever seen. That included a multi kw linear that that demonstrated the art in radio design.

Doesnt mean it wasnt a golden screw driver of course.

Im going to order some silver steel (tooling steel) and see if i can fabricate a suitable nut setter on my CNC. It will be tricky as i dont really have the spindle speed for the size bits ill need for this job.

Cheers
J

Rick,

I have a TS450SAT and love it. I works great and I only bought it two years ago used on Craig's List. I keep it at my vacation home and it works great. Since then I have bought a brand new TS480SAT. Love it also, but for casual operators like you and me, it performs on a very similar performance level to the 450. So, I would recommend keeping it. New rigs have more bells and whistles and are nice and shiny but most of us rely on the basics 95% of the time. The 450 has the basics.

Good luck and sleep easier.

Thought I'd weigh in on this issue. I have a TS-690S that I've had for a couple of years, maybe 3. I have a headset and use VOX, and also computer control cables for my contest logging and my general logging. I do like having 6m on this radio as well, albeit at 50w.

It is solid, reliable, and easy to use - most everything I need is only a button push or or a turn of the dial. Split operation is simple.

This past weekend, I made myself use my FT-897 in the ARRL DX Phone contest instead of the 690s. Even with the DSP, I was nowhere near as happy as I am with the 690s. Has strengthened my resolve to retain the 690s. The only reasons I'm looking at the 590s, are diversity receive and DSP. First, I intend to improve my antennas and perhaps do a little preventative maintenance on the 690.

I will relegate the Yaesu back to VHF which is what I originally bought it for anyway. I like having 100w on 6 meters, and will probably add a transverter to get 220 for VHF grid chasing and contests.

Your mileage may vary, but I think this family of 450/850/690 are keepers!

Rick and Tom,

I have the new gear (ic7600 & IC756pro3) and I can tell you you haven't missedmuch. I too have a 450 and I am very happy with it. It sits on top of the 7600 and I use it allot.

I wouldn't waste my time worrying what you are missing. It "aint no big deal" as they say.

Hi,
You have a nice rig to start with. The only shortcoming I ever felt about the TS-450 I had was that strong signals on nearby frequencies desensitized the radio. This is only a problem if you want to use it in a difficult environment (perhaps FD with other stations very close nearby both in frequency and distance).

Another thing you could do short of a new transceiver is get an outboard DSP to help in QRN reduction during warmer part of year. I use a Heil Sound ClearSpeech DSP with my Kenwood TS-850 and it does a superb job of reducing QRN. I don't think Heil has this product anymore but there are alternate audio DSPs that would really help you out.

Obsolescence may become a problem at some point in time. There are ICs used in the 450 that are a long time out of production and if one fails in your rig ever fails, getting it repaired may become problematic.

I've owned a 440, a 450, a 690 and an 850 and the incremental step of improvement between the TS-440 and TS-450 was a giant step. I love my TS-850 but I may not hurry to go to a TS-590 although I would like one. :-)
73,
Mel - KF6OZ

#1 Rule; "If it ain't broke, don't fix it"

To be safe remove the covers and tilt the front panel over. Carefully tilt the battery over slightly and look for any signs of leakage. Mainly discolored thru-holes or a white powder on the back of the battery. If all clear button it back up and keep talking...

11996. Accessing Files

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-03-13 11:38:39 UTC
From: hoyt_n2jdk
Topic: 11996 Message: 11996

Hi to all from a new member,
While trying to view items posted in the files section, I keep getting this statement " Windows cannot access the specified device,path,or file. You may not have the appropriate permissions to access the item."
Any ideas as to what I can do to allow me to view the files section? Looks like alot of neat stuff posted there.
Thanks

Hoyt

Thanks Clif
Took a peak, can not see any corrosion (so far) around the battery.

hi guys once agn im going to selll or try to sell my ts-850sat kenwood it has a problem im not a tech and dont have the stuff to check it with if i new what i was checking but i just had it repair in april last year new finals , battery , few caps voltage regular,and alinged, all at avvid clif done a great job on this rig . here is the best i can tell you what it is doing it set on the shelf for abt 7 months
it for abt 3months after i got it bak from clif worked great love this olld rig but that cost me over 300.00 plus to get it fix but it needed clif did a super job on this rig .

ok pull down from shelf was goin to work the rtty contest and pluged it up turned it on an at once it started at 14.000.00 and went to 30.000.00 and stop there u got audio recive come out u got transmit . so i did a full reset ????
ser # 61xxxxxx newer chips voive recorder inside no mic no cables im using them on anothere rig sri .
iid like to start a bid at 400.00(((reserve not met)))) and see where it goes plus s&h if anyone interested email me i can send you pictures send me your phone number ill call you ..

tnx for listen to me cry

12001. TS-850 Audio hiss

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-03-14 20:05:31 UTC
From: Adi Toplician
Topic: 12001 Message: 12001

Hello

I am the owner of a TS-850 S/N 308XXXX, and I am quite happy with the rig. Signals are crisp and clear and the behavior under strong signal conditions is rather good.

Today I open it up and the good news is that the CAR DDS board has x312 chips on it. I also discover two 10uF/16V capacitor with electrolyte around the, not much but is there. This weekend I plan to change them all. I also inspect the digital/display board, battery, etc and everything seems to be fine. I don?t know is it is a good idea to change those capacitors too.

I work mostly CW and I have an Inrad #103 on 1st IF and 500Hz Kenwood on second IF. What I notice is a blow-by when selecting the Inrad on 8.83 and 2.7 KHz on 455 IF. Cascading the two will eliminate the blow-by. Slope tune is wonderful now!

But, what is annoying is an audio hiss when using CW filters, one or both of them.

The hiss is obvious even on turning AF gain counterclockwise.

Is there a modification for audio roll-off?

Maybe, adding a capacitor on audio chain will solve something. A solution could be an outboard DSP but this is quite expensive.

This is most obvious when using quality phones. With 8-16Ohms phones is not so disturbing but it is distracting.

I wonder if anyone found a solution to this issue.

Any input will be highly appreciated!

Thanks!

73! Adi

12007. TS-850SAT Losing power - Revisited.

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-03-16 14:50:31 UTC
From: telboy_vhs
Topic: 12007 Message: 12007

Hi group,

Managed to spend a little time exploring one of my 850's that reduces output power as the frequency is increased.

Here's some of the results....
ATU inactive.
Dummy load; CAR max, PWR Max.

Freq	PWR	ALC reading
1.8	100	Max
3.5	100	Max
7	70	Max
10	100	Max
14	12	No reading
18	25	No reading
21	1	No reading
24	1	No reading
28	0	No reading
29	0	No reading

After a search of the internet I was pointed towards the 74LS145 (IC1) on the RF unit.
Having checked this, I can confirm that all the output (A, B, C and D) switch between 5V or 0V as the band is changed. See below:

Readings from IC1 RF (3120) unit:

Freq	D	C	B	A
1.8	0	1	0	0
3.5	1	0	0	0
7.1	0	0	0	0
10	0	1	1	1
14	0	0	1	1
18	1	0	0	1
21	0	1	1	0
24	0	1	0	1
28	0	1	0	1
29	0	1	0	1

Not sure if the binary map os correct, but confirms to me that none are being held low.
One observation is that the diode housed in the glass envelope on the small antenna PCB looks slightly discoloured compared to another rig.
I believe that the radio in question may have been subject to a high RF on the RX?

I wonder if anybody can direct me towards some other areas that I can test please?
Am I missing something obvious?

TIA es 73,
Terry G0VHS

Wilson,
Thanks for the reply, and since then I have been thinking about what you said, 'to know how to use everything' on the rig. I wonder if there are a few tricks to using the 450's features that the manual doesn't spell out plainly!
Any advice.

Rick

Do you guys maybe have a button physically stuck in?
I've had it happen on several radios and other devices that sit around unused, then with the first press - they won't pop back out. Well, the outer cover might look normal but the contacts are stuck. Several more presses and they sometimes start working again. Sometimes not.

Looks like something I best leave alone...not as simple as adjusting two pots until they (USB/LSB) sound the same when zero beating WWV.

Serial port or USB?

I have some RASCAL's from Buxcomm that work really well. I have an XP with
6 serial ports. 73
Tom W7WHY

What is everyone using for a sound card interface.
I'm thinking of trying JT65.

73,
Kevin

RigBlaster Pro, USB w/ Serial-USB adapter cord. It has audio, PTT, CW, and FSK interfaces. Unless you use only VOX, you need at least PTT as well.

The original post asked about sound card interfaces...not rig control,
CW, FSK.

The Unified Microsystems interface does PTT and transformer audio isolation.

Having everything in one box (such as the RigBlaster
Pro or other) eliminates having to change boxes
down the road when adding other modes + rig control.
The TS850 can do a lot more than just AF modes.
The box you mentioned does ONLY AF + PTT
interfacing.

The RigBlaster Pro is not inexpensive
and the Unified Microsystems interface is but,
you get what you pay for.

Clif,

The input and outputs to the 74LS145 are:

i/p PIN12 - 0V
P13 - 0V
P14 - 4.7V
P15 - 4.7V

o/p
PIN1 - 11.2V
P2 - 0.9V
P3 - 11.2V
P4 - 0.3V
P5 - 11.2V
P6 - 11.2V
P7 - 11.15V
P9 - 11.06
P10 - 11.2V
P11 - 11.2V

Do those figures look reasonable?
Terry

You're welcome, Kevin. The best thing about that box is,
there's not much to lose WHEN you want more features
(such as CW, RTTY, rig control) than the simple
boxes can support.

Clif,

I'm chasing a fried Q49 on the back of the RF board. Also output on Pin 2 of the 74LS145 is permanently at 0.8V...is that clapped as well do ya reckon?
Cheers,
Terry G0VHS

Topic: 12032 Message: 12032

I've recently sold my trusty TS-850,and have
3 new never taken out of package DC-DC boards
that were bought with a bulk package
of other parts as backups.
I have no use for these anymore,and hate to just toss them
away...
If anyone would like one,just send
a SASE to my QRZ address.A couple of bucks would be
nice,as these were $10 a piece, but, not necessary,
as I just want to see them not get thrown away.

Thanks...

Nope, they tell me you have 2 filters turned on at the same time which is causing your problem. Usually it's D5 that is leaky but could be D17. With Pin 2 being that low though its probably the IC itself.

You can try removing D5 and checking Pin 2, if still low try D17. If still low the IC is bad.

I need the extension feet for my TS-870S. If anyone has a spare set or knows of a source that actually has them, I would like to hear from you.

Steve, N4JQQ

12037. Replacement surge protector

Yahoo group: TS-850_450_690 (2010 — 2016)

Hi all,

Im finalising a number of repairs to my radio, including the all important recapping and battery replacements. So far so good.

Unfortunately during testing i failed to notice a fault in my antenna setup and had the surge protector light up. No other damage is apparent at this time.

Im assuming the surge protector is a one hit component?

i shut down very quickly once i noted the problem and there is a little discoloration on the protector.

So assuming it needs replacing, any recommended source or alternative component?

J

Hi,
I am aware that a UK source has listed a replacement surge device on
Ebay but there may be many more sources for this part.

They are still available from Kenwood... Why go elsewhere? I think I dealt with East Coast Transistor... But you can just search "kenwood parts"... Google is your friend!

Cheers,
Chuck, WA3CEJ

Cliff,

Changed out Q49, and replaced and socketed the 145. Diodes checked out fine.
Output power is now restored.

Thanks for your pointers.

So I checked every voltage as described at page 172 of the service manual, TRX on a dummy, in manual mode it worrks fine and in automatic, somtimes it switches off.
Got some writings of other hams, who have the same trouble, but also no solution.
any addition ideas
tnx and happy Easter

Go to the Extended Menu (Hold down Scan & TX-M.CH button and turn on). Look at Menu #3, it should be OFF.

I have had a similar problem. Mine will tune some places and others it will not. Some of the time stopping and restarting the tuner makes it work. ???

Topic: 11918 Message: 12049

With my TS-850, there has been occasions when the auto tuner for some reason can't find a suitable match. When this happens I go into the menu funtion and use the tuner in Manual Tune Mode and am able to get a good match.

12050. Re: TS-850 automatic tuner failure pherhaps a solution !

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-04-01 14:39:02 UTC
From: joe
Topic: 11918 Message: 12050

Yesterday I got one step further!

In the service manual on page 172, there is the AT described.
After checking all voltages as described, I fond TC1.
in the middle of the left page, there is TC1.
You find it if you remove the top back cover of the tuner
Then I did tuning on a dummy load and during tuning I adjust TC1 carefully. I can hear, that the behavior of the "tuning tone" changes from faster to slower and voila the tuner switches off automaticly.
If the anoying "rit rit" tone is reached, before the tuner switches off you can force a new tuning over by moving the car knob fully CCW, wait 3-4 seconds and than moving fully CW.
Mine now is 90% ok, some antennas can not be tuned, but in that case I am using manual mode

12052. Introductions, and a question or two

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-04-04 13:10:58 UTC
From: W3LZK
Topic: 12052 Message: 12052

Greetings to the members of the group, I have been remiss and have not properly introduced myself to the group like I usually do whenever I join a new group. My name is Mark my call is AI4HO, I live in Vero Beach, Fl, I have been a licensed ham since 1995, but have only been active for about the last 10 years. I enjoy most aspects of the hobby, but my true love in this hobby is rag chewing.

That said, I recently bought a TS-450S/AT, well, I guess it has been a month since I got. I have multiple Kenwood rigs in my home, and my truck, my mobile HF is a TS-480HX 200 watt to a full size Tar Heel screwdriver antenna, my VHF/UHF rig in the house is a D700A, with APRS, and Sky Command. I also have 2 HT's, a TH-F6A, and my most recent purchase a TH-D72A which is a D700/D710, only in an HT version. My main HF rig is an Icom 756 ProIII, but that isn't what I am here for.

Once upon a time ago, back when I had my first TS-480HX or my TS-570D/G, don't remember which, think it was the 570D, some one in the 570 yahoo group had information on how to get or how to read the serial number, something, pertaining to when the rig was made, where the rig was made, etc. I was wondering if anyone in the group here may know what web site one can go to to find this information. So far my searches have revealed nada, nothing. Don't know if I not wording it correctly or what. I am just curious as to when this particular rig was manufactured, the former owner, took exceptional care of this rig. It was his very first rig, he never said when he got it, just said he bought it new.

Wanted to introduce myself haven't been well, my disease has been rearing its ugly head and has kept me down for way too long now. But, we have a little energy, today, so hopefully I'm turning things around albeit temporarily, but I'll take anything I can get, thanks to everyone,

73 de Mark
AI4HO

12053. TS450 low receive audio

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-04-05 22:13:00 UTC
From: DonP
Topic: 12053 Message: 12053

Our group station is a TS450 & SGC auto-tuner. I'm trying to find out why the receive audio level is so low.
What I've tried:
RF gain is all the way up.
I've set the filter switches to their "noisiest" positions. Same for Notch & IF shift.
Disconnected the antenna & tuner and stuck a piece of wire into the antenna jack.
Haven't tried an external speaker.
I have the AF gain all the way up, and volume is only mediocre. Headphone volume is also low.
I'm wondering if there is some other setting I'm missing.

The dreaded leaking capacitor - I lost a 450 like that too, AF audio got weaker and weaker over time. I forget where the capacitor that leaked is located, but I have since seen many other reports
with the same failure.
I'm sure Clif will jump in and provide the info where to look. You just need to get it done quickly before
other parts of the board are not destroyed

Just got my HF ticket on Saturday. Bought a Kenwood TS-850 from a ham who got it from a silent key last year. It's my first HF radio. I know very little about HF, just what I've been studying, so my practical experience is lacking. I am glad I stumbled on this group! Perhaps there have been a bunch of newbs who have joined the group, and info to explore, but I haven't browsed much content yet.

Just thought I'd say hi.

Oh and my club at University of Akron is launching a High Altitude Balloon on Saturday, we are putting a cross band repeater on it, if you are anywhere in central to eastern USA, you may be able to get to us. http://wiki.w8upd.org/wiki/HABP1

Hey! I share your enthusiasm. Though I'm just learning. It doesn't have the Digital module, and when I press the filters options I have 12 and 2.7 on the 8.83 side and 12, 6 and 2.7 on the 455 side. I don't know where else to look, but have loved most of the dails and controls front facing, because I can try things without menus!

Enjoy your new radio. You're starting with one of the best HF radios out there. I've had mine since 1995 or so and have no desire to change. Do you have any "extras" installed in it?73 and welcome. Bob WE6C

Just got my HF ticket on Saturday. Bought a Kenwood TS-850 from a ham who got it from a silent key last year. It's my first HF radio. I know very little about HF, just what I've been studying, so my practical experience is lacking. I am glad I stumbled on this group! Perhaps there have been a bunch of newbs who have joined the group, and info to explore, but I haven't browsed much content yet.

Just thought I'd say hi.

Oh and my club at University of Akron is launching a High Altitude Balloon on Saturday, we are putting a cross band repeater on it, if you are anywhere in central to eastern USA, you may be able to get to us. http://wiki.w8upd.org/wiki/HABP1

Hey! I share your enthusiasm. Though I'm just learning. It doesn't have the Digital module, and when I press the filters options I have 12 and 2.7 on the 8.83 side and 12, 6 and 2.7 on the 455 side. I don't know where else to look, but have loved most of the dails and controls front facing, because I can try things without menus!

12067. Kenwood TS 450 - CAT Control not working

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-04-13 02:50:15 UTC
From: Scott

Does anyone in the group here use WSJT-X and work JT9 using CAT control?

I cannot get it to work and I believe the settings are set correctly. COM1, 8 Data bits, 4800 Serial Rate, 2 Stop bits and No handshake. These are the same settings I successfully use on HRD, ACLog and N1MM. I have a serial port on my computer so there's no drivers or anything that need installed. Does anyone have any ideas at all why CAT isn't working?

Thanks in advance.

Hi Scott

I use CAT control here with my '450's and the settings are 4800, N, 8, 2 - Handshake, Handshake.

I've used these settings with JT-65, and lots of other digital modes. 73

I have a TS-450SAT that I bought from a buddy back in 2001. I was excited about my tech license and thought I would immediately go for my General, but life got in the way. I finally got my General in 2010 and was able to put the TS-450 to work. I have to admit that I'm still learning the ins and outs of the rig (and HF in general...no pun intended), but I'm tempted by the newer rigs and newer technologies. I was just curious, for those who have the TS-450, what your next rig was...or what your desired next rig is.

Thanks, Steve

Steve,

Good for you. Glad to see you got your general and you are continuing on your ham radio journey. I am pretty much a Kenwood man and have been licensed for 43 years. I have both the TS450SAT and the TS480SAT and love them both. They work fine for me for what I do. I do a little bit of everthing....DX chasing, local nets, a little bit of contesting, etc. I also live ham radio on a budget so I am not one to purchase the big luxury rigs. I find I can do most of what I want with the rigs I have. I have deed restrictions so my antenna farm is modest and stealth. I do have a restored Heath SB200 linear to help out on getting some of those DX contacts.

My only piece of advice would be to become a really good operator with the rig you have and know and understand most of the features on the 450. Once you master them and realize you need more, then it may be time to upgrade to the next level. For me the differences between the 450 and 480 are minimal from a practical standpoint and for what I do.

You asked a pretty open ended question, so you are bound to get lots of opinions, which is probably exactly what you were looking for.

Good luck and 73,

Tom AF8P

Steve I like the 450SAT as well as anything I have had. I had a couple TS2000 radios. The first one the vhf finals went out in right away. Sent it back to the dealer, got another one, and soon sold it. Never did like the idea of all your radios in one box. So if I get anything else it would be a TS870 if I can ever find one.

The newer radios just have too many functions I never did use, and I always suspected if I kept the second 2000 long enough it would have something that would shoot craps.

My .02 cents worth. I like to keep them simple.

I have been using a TS-850 for years. I have used a TS-450. I would say it is a great radio for 99% of what most hams would need to do. If I wanted a newer rig I would buy the TS-590. For the receiver and the price, it is a great deal. If you like the 450, use it and enjoy it. The grass always seems greener on the other side of the fence.
I will tell any one, to get the most out of any rig, the antenna is the most important part of your station. 73

WOW! Thanks for the replies! I agree that I need to learn more about this rig. I hate to admit it, but I finally took some time with the manual to lean how to program the scan ranges. That in itself was huge, for me, as it allows me to multi-task while the scan is running rather than tuning the dial manually. So the lesson there, was to invest some more time in the manual and search the archives here and the Net for additional tips and tricks.

As to antenna, I recently replaced the MA5V with the R8. I'm using verticals, due to W.A.F. (wife approval factor). I'd love to get a yagi up at some point.

As to CW...I find it interesting, and it isn't THAT surprising, that when my father and I took an introductory class, when I was in high school, I didn't have the interest or patience for CW. But now, in my 50's and continuing with the hobby, I'm becoming more and more interested. I enjoy music and feel if I put some effort, that picking up CW won't be too difficult. We also have a slow-CW net that my club has been doing.

Thanks again for the replies. I really do appreciate both the rig AND operator improvement opinions.

Thanks, Steve

Hi Steve,

I used a TS-450SAT for a number of years at my shack in Maine. I just upgraded to a 590. Very happy with the change. My other choice was a K3, but the reports of harsh audio and twice the price for an equivalent rig pushed me to the 590. (Plus I've had a 430, and use a TS-2000 at my shack here in MA, so I guess I'm a Kenwood guy!)

You will be happy with the 590. Better selectivity and noise reduction. Excellent on SSB and quite good on CW.

I have a TS-850S/AT that I purchased new in 1992. I've done the major mods to it and a couple of repairs. It's still going strong. But I could use some decent roofing filters, so I considered the TS-590. However, I passed because aside the roofing filters, the TS-590 does not have what I need. I really wanted a remotely accessable voice playback similar to the arrangement used by the TS-850 but that feature is not available on the TS-590. The voice playback for contesting, etc is only accessable via the front panel or via computer. It is not safe during mobile operation and very inconvenient during camping, portable and field day operation when using batteries. Also, the repeated use of the front panel playback buttons will eventually wear out the paint on the buttons. Another feature that I want is the ability to convert the automatic antenna tuner into a manual tuner. There have been more than a few occassions when operating portable, where the match is under 3 to 1, but the auto tuner could not find a match. Going to manual mode, I could always find a match if the SWR was under 3 to 1. The TS-590 does not have a manual tune mode. For a time, I was discussing these issue with Kenwood, but so far they have no plans to incorporate these features in a TS-590 price class radio. I am considering getting the 5Khz roofing filter offered by Inrad which will help. But I really want a 3Khz filter that I could switch in or out as needed.

Steve,

My main rig is an Icom 756 ProIII that I've had for about 4 years now, still not a lot of hours on it. I bought my TS-450 from a guy in Michigan about a month, maybe 6 weeks ago now, and I love it it, lately the 450 has been getting more use than the Pro III. Don't get me wrong, there is nothing wrong with the ProIII, but lately I have been getting the wants for the TS-590. No reason really, unless its the fact that every other rig I own is a Kenwood. Besides the TS-450, there is the TS-480HX (200 watts) I have in my truck, a D-700A dual band, and my 2 HT's the TH-F6A, and my TH-D72A. I dunno, part of me says...sell the ProIII and get the 590, the other part says, no reason to part with an outstanding rig like the ProIII. Time will tell, time will tell.

I have the TS-690s, and am considering a newer rig. I bought a Yaesu FT-897D, and have made myself use it for HF, even in a contest or two . . . I did not like the extensive need to select layered menus, at all. Even working split seems much more cumbersome. I will probably keep the 897 for VHF work, but I 'm now considering a TS-590s to keep the "big rig" look and feel, as well as add diversity receive and DSP.

Still, the antenna arguments are correct . . . if I invested in a better antenna system, and spent some time locating and correcting some of my local noise issues, the 690 would still be all I need, frankly.

So many options, and we all suffer from "grass is always greener" syndrome, I guess.

Just my 2 cents.

This is great advice Tom. To that end, one of
the best features of the TS-450/690 that you
don't find in other rigs (even it's big brother
the TS-850 and subsequent rigs) is the RX
Meter. In my informal polling on the air and
online, most operators using the TS-450/690 don't
understand or don't use this powerful
feature. Most may have it engaged, looking at
the bar graph LEDs flicker away reflecting
received audio level, but do nothing more.

The power of this feature shines when used in
combination with the RF Gain adjustment. Once a
desired signal is tuned in with desired
filtering, with the RX Meter active, back off the
RF Gain until the peaks of the receive signal on
the RX Meter bar graph just start to come off the
0 dB point. This is that magical sweet spot
point where AGC is not backing off the desired
signal, resulting in maximum signal to
noise. Back off RF Gain further and you start to
reduce the desired signal. Back off RF Gain less
from this point and you increase noise and AGC
starts to cut back the desired signal.

It really is a powerful feature that I wish was
incorporated into other rigs. In fact I don't
know of another rig that has it. Anyone know of
one? I don't know if Kenwood has incorporated it
into its latest rigs (TS-590 / TS-990). Perhaps
someone could tell me that. If they did, I'd be
inclined to relegate my TS-690 to backup rig status and upgrade.

Hope this helps.

Well, Steve, I joined this group not long ago myself. I am an original owner of my ts-450 and asked if i ought to upgrade. I really like the rig, get lots of enjoyment from it. And after listening to the input I got on the group, I plan to continue to enjoy the 450 for quite a few more years to come.

I got my 450SAT about a year ago and I'm still growing into it. At this point, i can't see replacing it so much as supplementing it. Like adding a RigBlaster or something like it. Upgrading mmy antenna and feedline, etc.

New rigs will be ones that do other things. Like putting a mobile rig in my car. I've got an FT-2900R I use alongside the 450 now, and I've got a TS-700A that I'd like to get on the air again with SSB. If that works, I might see about getting a TS-600A.

But replacing the 450SAT? Can't see that happening any time soon. I honestly don't know any features I'd like to add that would push it out of its place.

You are right about the way to operate the radio. That's the way I use mine. I never have the RF gain wide open.

It always amuses me to hear someone say they have the RF gain up and the attenuator in and this and that in and turned on, all for naught. Everyone should operate their radio the way it pleases them, but I thoroughly agree with the way you describe the RF gain and AGC action. I'm not saying that is wrong, nor my way is the right way, but it works for me. Dave W0DLR 73

OK, I usually lurk in the background and listen... But this topic struck a chord, and I can't resist responding. There is a feature in this vintage of Kenwood radios that I have never heard of anyone other than me exploiting...

I am mostly a techie, more interested in making my shack do what I want it to do than actually operating and getting awards and such. But I do like to engage in DXing, and track my progress even if I don't actually apply for the awards. I use some nice software (www.dxlabsuite.com) to track my progress and to provide spot listings that will activate QSY and mode settings to chase DX easily.

Well, after my TS-440, I got a TS-450SAT, and then developed an operating technique for split operations that I've never heard used by anyone else. On a relatively recent visit to HRO, I played with a number of modern rigs, and asked the sales professionals for help trying to do this... Not one radio that they currently sell would do this (well the Yeasu's theoretically could do it, but no one knew how to do it).

OK, so I get a spot for needed DX operating split. I double click on it and my trusty TS-450 QSYs both VFOs, sets mode and split and I'm good to go. I hear the DX (mode is arbitrary -- in this case CW), and validate his callsign, but conditions warrant the 500 Hz filter. I hit & hold the T-F button to listen to his RX frequency (QSX). The stations calling him are all over the place, and I can hear them because VFO B has the 2.7 KHz filter enabled. Cool!!! Now, with one finger holding the T-F button in I can tune a calling station with my thumb. Letting go of the T-F button, I can listen for the DX to send "xxx 599", then hit T-F to listen for a note that is sending "599 TU" and use my thumb to tune him in and be ready to send my callsign at the next opportunity...

Believe it not, a TS-2000 CANNOT select different filters for the VFOs. I would be surprised if the 590 or 990 would do it (anyone here know for sure?). This, to me, is a step in the wrong direction. So it has made me a believer in the capabilities of the TS-450/850 series! I have a friend who has a bazillion dollar station, a REAL DXer, who watched me work a "new one" one day. He was impressed (he was also with me on the HRO visit). He called it my "poor man's band-scope" (with admiration).

Does anyone here know of any other radios that will assign different filters based on VFO selection in such a useful way?

(Still remember my DX-100B & NC-155, and the step forward to the Swan 350!!! And several other RX/TX combinations of the era. I remember them fondly, but I really don't want to go back!!)

Cheers es 73,
Chuck, WA3CEJ

Chuck, you hit the nail on the head with your observation. I don't
think you can do this with the TS-590 unless I'm missing something.

I have heard from hams worrying about the age of the 450s radios, and the availabilty of parts. I notice lots of parts/boards on Ebay. I had to replace a digital board on mine, and the chips are no longer available. It might behoove those of us that want to keep these radios alive buy some spare boards along.

I would sure hate to see mine die.

I do the same thing with my 850, use VFO "B" for TX with wide filters on CW so I can hear where the DX station is listening, and use narrow filters for my listening to the DX station. I would have thought that all newer rigs worked the same way but I guess not. Hello Mark BIT, I didn't know you were on this list. What antenna do you have up now?I missed you guys Friday night.
CU soon. Bob WE6C

From: Tom Osborne
Topic: 12080 Message: 12092

Now, that is some good info.

I've never tried that and I do a lot of DX'ing and working split. Thanks for sharing Chuck.

I still also remember some of those cool rigs from the past - Drake 2B and B&W 5100 with the SSB adaptor was a fun setup. First rig was the 'popsicle stick' tranmitter and S-40B rx.

I still enjoy listening to the AMI group on 75. Need to get an AM setup here. 73
Tom W7WHY

OK, so I get a spot for needed DX operating split. I double click on it and my trusty TS-450 QSYs both VFOs, sets mode and split and I'm good to go. I hear the DX (mode is arbitrary -- in this case CW), and validate his callsign, but conditions warrant the 500 Hz filter. I hit & hold the T-F button to listen to his RX frequency (QSX). The stations calling him are all over the place, and I can hear them because VFO B has the 2.7 KHz filter enabled. Cool!!! Now, with one finger holding the T-F button in I can tune a calling station with my thumb. Letting go of the T-F button, I can listen for the DX to send "xxx 599", then hit T-F to listen for a note that is sending "599 TU" and use my thumb to tune him in and be ready to send my callsign at the next opportunity...

12093. Re: [TS-850_450_690] What was/is your next rig from the TS-450SAT?

Yahoo group: TS-850_450_690 (2010 — 2016)

You're right there.

If you plan on keeping your '450 or '80, when these parts become available, you should grab them. Probably be more valuable than gold :-)

I have some extra parts here for the '450 and not planning on getting rid of them. 73
Tom W7WHY

I have heard from hams worrying about the age of the 450s radios, and the availabilty of parts. I notice lots of parts/boards on Ebay. I had to replace a digital board on mine, and the chips are no longer available. It might behoove those of us that want to keep these radios alive buy some spare boards along.

I would sure hate to see mine die.

12094. Re: filters/ slope tune

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-04-16 11:32:28 UTC
From: Miro C
Topic: 11786 Message: 12094

Hi,
Slope tune works by changing the frequency of the oscillators second and third IF transition. When you have set ssb mode, regardless of the selected filter, retuning step is 200Hz. For CW, and set 500Hz or 270Hz for IF 8.83 and 500Hz/455k at the same time, step is reduced to 20Hz. Kenwood would allow for narrow filters, fine tuning the slopes of the filters (bandpass). So, when you have used a wide filter 2.1k / 8.83 instead of 270/8,83MHz and 2.1k/455k instead of 500/455k , it is due to too narrow tunable, the effect will be as you described.
At 99% it is not possible to change this step retuning.

Best regards
Miro SP2QOT

> I have two Inrad 2.1 filters (one at 8830 and one at 455). The 8830 when selected shows "270", the 455 shows "500". My switches marked #1 and #4 are set to "on", the others are "off".
>
> If I select both these filters, the slope tuning will only work in LSB or USB, not in CW mode. My filters seem to be in the correct places, from what I read in the other post. The switch settings as described in the manual are not clear to me, but I don't understand how they are wrong either. If I put #3 on instead of #4, the "500" lights up on the 8830 side, but I get almost no signals through (no filter there). I believe the filter is in the right place though. Hopefully someone can clear this up. I am supposed to be able to use both of them on CW right?

12095. Wanted: IF Board X48-3090-XX for TS-690S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-04-16 21:21:25 UTC
From: Bob - K2KI
Topic: 12095 Message: 12095

Hi to all and thanks for reading this post.

I have a TS-690S that has a completely butchered IF board (X48-3090-XX). Seems that a cap leeched it's contents onto the board and ate a lot of traces. There are conductive qualities to the board where there are no traces and all efforts to remedy this have failed. It also looks as if the previous owner used a chisel tipped iron to make repairs and caused much damage.

If you have the board or a donor radio for sale, please drop me a note.

Note: an IF board from a TS-450 will be just as suitable!

Side note... The Mic gain pot and knob is missing also. Will need those too.

Dave,
It ought to be since the TS-450S was sold in North America where the frequency allocations are broader for 40m and 80m in particular. I have opened up a TS-850SAT, UK version in this limited way myself. The logical approach is as follows:

1. Contact Kenwood UK Technical Support Department
2. Explain that you would like to convert your much loved Zone 1 [Europe] model to a Zone 2 { USA) model by adjusting the diode pattern to allow operation on 40m in the 7.0 to 7.3 mhz allocation.
3. Point out that with the fully open diode modification you run the risk of operating way out of band on many frequencies.
4. Ask them for the diode settings that you will have to adjust to modify only to a Zone 2, North American model. Then steady your nerves to implement.
5. You need to be aware that the US model also opens up 80m from 3.8 to 4.0 Mhz which may be an issue for you if you like to perch on 3.799 mhz when working transatlantic DX

Good luck to you and good DX
Jim M0YGW

Hi,

I'm very new to this hobby, I have an IC-751a but due to the lack of IF output I've decided to buy another transceiver. Based on my research it seems TS-850s/at is a very good choice. I would like to use it with LP-PAN adapter and PowerSDR/IF software.
I understand there are also some issues with TS-850s, caps, battery leaking, some serial numbers lot with more problems than others.
What do you advise me to check when I will buy a TS-850s ?

Thank you for any suggestions !

Dan

12108. [TS-850_450_690] Re: TS450 7.1 to 7.2 Mhz

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-04-27 19:32:33 UTC
From: N6EV - Paul Carreiro
Topic: 12099 Message: 12108

Dave,
You shouldn't need to contact Kenwood UK. The information is in the Service manual. I checked the files section for this Yahoo group and didn't see it (surprisingly). Perhaps due to its file size. So I just uploaded it to my website:
http://www.N6EV.com/files/TS-450S_690S_Service_Manual.pdf

First, the table at the top of page 4 for defines the destination codes. North America is "K", Europe is "E".

Next, go to page 141, the schematic for the Digital Unit. Look in the lower left corner for a small table showing the diode configuration for each destination. Compare the K with the E column should show you the two diode difference between the two zones.

Use the parts layout shown on page 140 to locate the two diodes.

Hope this helps.

Here we have a reply from the nice people at Kenwood UK.

"If you don't want to carry out the General Coverage TX mod then the next best would in theory be one that makes it a "General Market" (or "M2") version.
This expands TX to 1.800 ☐ 1.999, 3.500-3.999, 7.000-7.299 and 24.890-24.999MHz. All other bands' TX limits remain as is.
The USA mod has much wider TX limits including MARS coverage so not so suitable.
The M2 mod involves removing diodes D20, D21 and D23 plus adding back in D22 (all the same value)."

All I can say is good luck. If you find a non-working one make sure it's not the DDS IC's, they can't be replaced.

12114. ts-850 noise blanker mod

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-05-04 00:41:10 UTC
From: kd0mke
Topic: 12114 Message: 12114

Has anyone from the group performed the noise-blanker mod? If so were the results worth the effort and were any negative effects noted? I haven't much experience with this type of modification but I am willing to learn if results would be worthwhile. KD0MKE

There are two versions of the mod out.
One removed the chip capacitors,
the other is a simple cutting of the traces that connect the capacitors.

I chose the simple circuit trace(s) cut (2 small cuts) because the could be easily bridged with solder if I messed up. Be sure to double check and triple check your cuts before using the eXacto knife.

The results.... It made the NB actually WORK!
A virtually useless noise blanker now can take S9+10db power line static and make it possible to copy a station that was previously buried!

The NB level controls have some effect, but they are not too touchy. The NB2 width doesn't do much, but the NB2 was really only designed to counter the infamous "Russian woodpecker" over-the-horizon radar that plagued the HF bands in the 80's and 90's until the demise of the Soviet Union.

The original 850 NB was an "improvement" over the pretty effective one in the 820 and 830. But it was dismal in my book. The capacitors rounded off the noise pulses so badly that they didn't trigger the RF blanking switch.

This is one of only two mods that I have done on my TS850SAT. The other being the simple "diode cut" that allowed me access to the new 60 meter band when it was opened many years ago.

I haven't done the noise blanker mod but plan on doing that some time soon. I did the mod to open up the transmit for all the shortwave spectrum so I could transmit on 60 meters. I also did the mod to bypass the BC band filters. I have not had any problems with intermod from AM broadcast stations since doing that, and I live 5 miles from an AM transmitter.

On the 850, All I had to do was cut the diode. It has been 15 years or so, so I don't remember which one. It required removing the front panel and dropping it down. I suppose someone good with a very long, thin snipper could get behind the panel and clip it without removing the panel. But my fat fingers wouldn't go there.

There are several lists of mods on various websites. Just Google TS-850 mods and read carefully.

I have done the 60 meter mod and the NB mod. I wanted to bypass the BC band attenuator but didn't want to open things up again to that extent. I also came up with my own mod for a second CW keying input for computer keying... I traced the proper place down to a diode junction, etc. but I never got around to it.

You can either remove the diode or cut the trace to it. I remember it as a glass surface-mount diode. There is a third option, which is to smash the diode with a pair of side-cutters. A lot of people are not comfortable doing surface-mount work. That's about all I do these days so I had no problem removing the diode (a common 1N4148 type).

Here is a page with lots of great links for the 850...

http://www.dxzone.com/catalog/Radio_Equipment/HF_Transceivers/Kenwood_TS-850/

And here is are some links to mods...

http://www.kb2ljj.com/data/kenwood/ts-850.htm#2750

Read carefully..."Measure twice, cut once!"

Have fun. The 850 is a great rig, even after 20 years.
I regret that I will need to sell mine when my FLEX-6500 arrives.

12124. Introduction

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-05-10 16:26:53 UTC
From: W3LZK
Topic: 990 Message: 12124

This is very late, I should have done this a month ago, but due to my being sick was unable to do so. With that let me introduce myself to the group. My name is Mark Timblin AI4HO, I live in Vero Beach, Fl. and am the proud owner of a really, really nice TS-450S and the companion MC-60 desk mic.

I have owned this rig, maybe 2 months now, and haven't had a lot of air time with this neat little rig. What air time I have had and the little bit I've used it, I am duly impressed with the TS-450S, it isn't in the same league as my 756 ProIII, but it is still an impressive little rig. I recently was able to find on EBay or Amazon the CAT control cable for the TS-450/690 rigs, and have already downloaded an am using HRD ver 5. point what ever don't know or remember off hand. This, has opened up another aspect that is quite helpful, the fine tuning, now I can see exactly what frequency I'm on and if some is on 21.252.4, then I can tune to 21.252.4 and not be off frequency.

I do apologize for not introducing myself earlier, however I am kind of a slave to this monster pain disease that I have been fighting for over 20 years. I will attempt to stay current and partake in any conversations pertaining to the TS-450S as long as I can contribute something positive, or meaningful I will, but for now my knowledge of this nice, nifty little rig other than basic knowledge is nil. However over the next weeks and months hope to remedy that. Thank you very much for allowing me the opportunity to join your fine group here.

73 de Mark
AI4HO

Hi All,
When I modified mine, I snipped a diode out and that gave me the "DC to Light" coverage that
I needed for the NAVMARCORMARS frequencies, including the new 60M coverage.

I usually leave my 450sat turned on 24/7. A few days ago a thunderstorm rolled in and I unhooked everything for a day or so. When I turned it back on the audio was slow in coming back on. The Smeter appeared to be full scale. I could turn the RF gain from full left to full right and it would come up momentarily, after a minute or so it was all right.

Is this something to be alarmed about or is a train wreck just down the road?

Sounds like C18 on the RF board is leaking it guts over the board time to remove it and do a major clean up of the board and put in a new C18.
I just did one last week on a 450 I picked up.

I bought an 850 some time ago and didn't like the case and faceplate! It is amazing what some people can do to these!

Anyway,,i now have newer top and bottom casings and a better looking faceplate!

The question is how to remove all the knobs, etc! Would appreciate some feeback on how to proceed! Any special tools,,screwdrivers, etc!

I also need to install the SO-2

12138. VOX and Monitor in Kenwood TS-850S - IF board problem during rig refiting

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-05-19 14:30:32 UTC
From: sp9xwd
Topic: 12138 Message: 12138

Hi,

My friends, I am after few years of "break" in my hobby, I am back last months in to the amateur radio activity.

However my old lovely rig TS-850s hasn't work as good as I remembered.
Before I describe the "old" and "new" problems, please, here You have the list of the equipment
TS-850S/AT (serial no. over 60 mil.)
DLP-100
SM-230
MC-43 / MC-60 / MC-90

When I started two months ago my problems were severe:

- the signal processor don't work properly - even on the minimum level the working PROC started the strange noise on my carrier signal (the same problem happen now with the DSP-100)
- the antenna tuner couldn't match even the perfect antenna
- I really don't like to say how "interesting" was modulation...
- the power in the peak (CW) was below 70W ... on SSB ca. 50W

- moreover the battery was OLD ... really old.

I have changed the battery from the COM board... (fortunately, it was corroding, but not leaking)
I also changed all capacitors on the COM board - surprisingly it solved the problem with the antenna tuner (now it work better (faster) than I remember)

I changed the DC-DC small board for the replacement proposed by Lars
OZ1BXM - the signal processor works now properly (but only if I worked in the headphones) ... with speaker the processor still produce the notice on the carrier.

I decided to exchange ALL capacitor in the TS-850 and DSP-100 ...
and I started from the IF board (ca. 50 capacitors)
The result - positive - the power of the rig is now equal 100W (I just exchanged capacitors - I suspected that the power problem was caused by the TWO capacitors 470uF in the corner of the board. My signal is now much better (modulation) ... and more stronger ... - it is information from my correspondents.

However ... I have also the negative results ---

I did some mistake during the exchanging - and now my VOX and Monitor don't work. I checked all capacitors soldering and all connections on the both sides of the board ... and found no source of problem.

Let us assume that it is the problem with the IF board (not with the DDS board - let say it clear - I haven't touch yet DDS (66312) board, and it worked perfectly before I started the work with IF board.

Can somebody to help - how to find the source of the problem? Probably it will be somewhere in the demodulation section on the board? But how I can follow the signal from DDS (CN7) and find the "break" of it?
As I said I have the oscilloscope (SM-230 station) and can arrange other oscilloscope and signal generator... But I really need an "simple" instruction how to proceed it.

Vy 73!

John I got the battery and the battery holder at Radio Shack. I took the battery holder out of the board and wired a couple jumpers and moved the battery to a little slot between the tuner and the rest of the radio. Works just fine, wrapped it in black tape so it didn't touch anything. Now to change it, just slip it out of the holder and put in a new one. There is a mod somewhere on the internet how to do that.

12142. TS-850, Rigblaster nomic and ACC2 port.

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-05-19 23:34:16 UTC
From: Tom
Topic: 12142 Message: 12142

I am looking for some advice to see if I am correct. I am trying to connect a Rigblaster nomic to the ACC2 port on my TS-850 for HRD DM780. I think I have the pinout correct but I just want to make sure. Pin 11 is the mic audio, pin 12 has the mic audio ground. Pins 3 and 4 cover the audio to the sound card. It's the PTT that I have doubts on. I believe the PTT is pin 13 with the other side going to the shield ground. I am planning to use a serial cable to the nomic so I will not have to use vox. I do see on the nomic pinout that the mic ground and the PTT ground are tied together, so I could tie the PTT ground to the mic ground but I am not sure that is the smartest way to go. Any advice would be greatly appreciated.

Tom, NW0LF

Hi all, I never had this problem with any other radio but scaled back and kept the TS-450 as my backup. My primary radio is going in the shop so I connect up the trusty old TS-450. I've never done digital with it but now that I want to, for some reason, I get a ton of squeal? with the Signalink hooked up. I'm told it doesn't sound like RF, and I agree but there is a squeal there for sure. Has anyone else had this or have any ideas? I've noticed it on most bands I go on. I know of someone else with the same problem but he doesn't use it near as often as I do so keeps the signalink disconnected. Thanks, 73

I had the same problem. It's RFI. If I turned down the power to 25 watts it was OK. I talked to Tech support for the Signal Link. They told me it was a ground issue. I do not believe the cable from the signal link to the accessory port of the radio is shielded. Where my shack is currently located, I do not have a good RF ground. I use a counterpoise system along the floor. The DC ground is at the ground connection at the wall outlet. Rerouting the cable from the signal link to the radio helped but did not completely solve the problem. I tried using those RF chokes you can get from MFJ or Radio Shack but that also did not help. I quit using the signal link and went back to the Home Brewed interface I built years ago. With that unit, the cable from the interface to the radio is shielded. The only problem is it uses the old style 25 pin serial port and not the USB port, so I have to use the old Windows 98SE computer and not my newer laptop. I would imagine if I had the ideal RF ground for my shack, it would not have been a problem.

That cable is not shielded, it's basically a cat5 cable cut and with a 13 pin DIN plug on one end. I'm in a trailer so basically grounded my station to the metal frame, if that's good enough or not I don't know but it seems to work so far. The main problem is I'm setup in the sun room but out of view from the windows so on an inside wall so could never get a ground rod in under there. Basically being a metal building though like a car that should be a decent ground. The problem does back off a lot when I back the power down so you're most likely right. Oh well, I'll have to try my rigblaster until the primary radio is back, that might work out better and I do have a shielded cable for that.

The TS-850S/AT can be set up to tune between two frequencies. I use this feature during contests and Field Day, so I will not operate outside my license class and Mode of operation. Memory Channels 90 - 99 are used for this purpose.

Refer to the TS-850S/AT Owner's Manual on page 38, Section C. Programmed Scan Memory Channel. The proceedures are detailed there. Be sure to account for the emmisions bandwidth when programming the upper and lower frequency limits. For example for upper side band, I set the frequencies 300hz ABOVE the lower frequency limit and 3Khz BELOW the upper frequency limit. For lower side band I set the frequencies 3Khz ABOVE the lower frequency limit and 300Hz BELOW the upper frequency limit.

It may take some practice to get it right. When you do get it right, you can go to that memory channel in Memory Mode and using the VFO dial tune within the frequency limits that were set. The VFO will not allow you to tune outside those limits. If you are able to tune outside the limits you thought you programmed, go back and try it again.

12158. "New" TS850

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-05-28 15:58:53 UTC
From: Richard Hanna
Topic: 12158 Message: 12158

I recently obtained a TS850 from a friend. who told me it was a parts rig.

He said that in 2001 he smelled something burning, powered off the rig and sent it to Kenwood. They returned it and told him it was not worth repairing. It has sat on the shelf since. I also got the manual and schematics with it.

Anyway, I powered the radio up this morning, and I hear noise on receive, but no signals. On transmit it is putting out about 75 watts into a dummy load on CW on all bands but 160 when I push the Xmit button, but only about 30 watts on 160 meters.

I do not see anything remarkable inside the radio.

Not being a Kenwood user I wonder...

1. Is the radio restorable or is is truly a "parts rig"? I realize probably not much on the way of parts available

2. Where should I look to start troubleshooting? I have not had any Kenwood equipment before. I do have a modest radio bench, and have done some repair work on older tube radios.

3. If the answer to (1) is its a parts rig, I do have the original carton and would consider selling the radio.

Thanks for any advice or help.

Dick, I would try to isolate the problem to one certain board if possible. You can find replacement good working boards from time to time off Ebay. I did that with a defunct 850s and it worked fine from then on. Don't scrap it, try to analyze the problem step by step and function by function. They are a wonderful radio, and with some time you can get it going.

Dave it looks like the RF board. C125 and everything around it is burned. It looks like components close to the cap are gone (Q12?). Interestingly I was able to get a signal through the receiver but it took a pretty strong one to get through. Not sure what the chip that Q12 feeds does.

Anyway, guess if I want to fix the beast I will need an RF board. Still wonder why Kenwood would say too costly to fix if it would have been change out a board? They were still available it 2001 weren't they?

Dick, I did a quick search of Ebay and didn't see an RF board on there. Keep watching it and one will show up. Usually boards are in the $100 range give or take.

I doubt that Kenwood has any of those parts in stock, I don't think they intend to support equipment very long, that way you can't fix it and will buy something new. Seems like every model has its shortcomings, my 450s had to have a digital board. Got it off Ebay for about $75 and it works like new again, but it was a known basket case when I got it.

Keep watching Ebay, you'll find a board sooner or later, they are an excellent radio, but like everything else, they will eventually give up.

Cliff ,
I just saw an add for a parts / fixer-upper this morning , it may have been on this reflector .
OLD-FARTERS , keeps me from remembering for sure where , I thought about getting , but I have 2 I fixed already .
I like these 850s a lot , if I get something else I would hope to be able to keep these , rather than use to get something else .
The Elecraft K3 with all the bells & whistles cost more than both 850s and all the acc. so it will be a while .
Thanks for being there .

If I remember correctly, C125 & Q12 on the RF board are labelled as a ripple filter.

A peak at the board also shows lots of traces in the vicinity...

As an owner of a 850s (which I hope will last as long as I do), is anyone aware of the failure mechanism here ??. Is there something that us happy 850 owners should be checking ??

From: Bob - K2KI
Topic: 12175 Message: 12175

Hi to all and thanks for reading this post.

I have a TS-690S that has a completely butchered IF board (X48-3090-XX).
Seems that a cap leeched it's contents onto the board and ate a lot of
traces. There are conductive qualities to the board where there are no
traces and all efforts to remedy this have failed. It also looks as if
the previous owner used a chisel tipped iron to make repairs and caused
much damage.

If you have the board or a donor radio for sale, please drop me a note.

Note: an IF board from a TS-450 will be just as suitable!

Side note... The Mic gain pot and knob is missing also. Will need those too.

Topic: 12176 Message: 12176

The cheap AD9850 ($5 ea) synth boards available on eBay sure makes that thought of a CAR replacement attractive.

There is no doubt that it would take a fair bit of work - since the data stream from the on-board processor would have to be decoded and changed to something that the AD9850 understands. This could easily be handled by a modern microcontroller.

It would appear that the most expensive component would be the new PC board. Much of the circuitry on the existing CAR boards can done away with - e.g. the CAR chips could not generate an 8 mhz RF signal directly.

The 450 would be a good testbed, since it only has a couple of CAR chips on it - does anyone have one with a dead CAR board to donate or sell cheap?? If I ever get it working, they can have it back - working.

Hi again

After few test I am sure that the source of this too high voltage is outside the IF
If I disconnectedthe IF / RF wire the problem still happen on the RF board.... (while F is out => 0 V)
therefore I should look for the source of the 8V analog - the wires (CN16 RF) show me the direction for the PA

Hi all,

The title says it all. I need this to complete my repair of my TS-690 I have been unable to find one via the commercial route. If you have one, please drop me a note.

Thanks es 73...
Bob de k2ki

12182. S-meter does not work in AGC-off position?!?

Yahoo group: TS-850_450_690 (2010 — 2016)

From: va3gru
Topic: 12182 Message: 12182

Hi. I purchased my 850 a few months ago, and overall it's a great rig - I made enough contacts for WAC in just over a week with this rig and coaxial dipoles on 20 and 40. However, there are a couple of quirks that need to be addressed.

I have had a few kenwood rigs over the years: 120, 520, 530 gold line, 430, 450 and now the 850, so I base my observations and comparisons on what I recall of the functioning of these radios.

This post will deal with the S-Meter problem, but will touch on the other problem I'm having, just incase they have something to do with each other, but I will make other posts for them specifically.

My 1st problem is this: My s-meter works fine in AGC Fast, Med & Slow but does not work in the AGC off position. I mean FLAT and NO movement at all! Any help with potential causes or troubleshooting suggestions are very appreciated. There are a couple of other quirks with this radio as well: When I tx without processor, with or without high-boost, everything is fine, mic gain dial set anywhere from 0 to full. However, when I tx with my Proc. on, I can't turn my mic gain up beyond 3 (10 o'clock position) or a weird sound - not unlike the sound arcing in an air variable capacitor makes when a tuner is being fed too much power - invariably results. My first investigations were to rule out arcing.

Also, (possibly Q49?) rx above 20m sounds deaf, especially when I compare it to what I remember of my 450 on the same antenna.

Please, any help, info or suggestions for troubleshooting and investigating the cause of this problem is very much appreciated.

Tnx, 73! Rob VA3GRU.

As I recall, with the 850 and 870, when you turn your processor on, the mic gain no longer functions.
If you correctly adjust your rig for best processor audio keeping the ALC well within the "confines" of the ALC arc, you should have excellent audio and won't have to even touch the mic gain.

AGC, Automatic Gain Control. The s-meter indicates the activity of the AGC. If it's turned off nothing to show, the gain level is fixed.

Read the owners manual for operation of the Mic Gain and Processor controls. You're not adjusting them correctly.

Q49 is either inline or out of line on all bands, it is not band specific and can't be turned off or on by the operator.

Clif

I have a 60 million + serial #, 850 for sale. Never around smoke. The rig has std filters, has the txco, auto tuner and the voice module. Cosmetics are a easy 9/10 . The rig has no operating issues of any kind. Comes with the kenwood hand mic and both operations and the full service manual. If any interest please get back off list.Have owned since new.
Iam asking 750.00 and free shipping for the ts-850.
thanks
dale wt4t

12186. "Feedback" type noise occurs when processor is engaged, mic. gain => 4

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-06-12 20:39:28 UTC
From: va3gru
Topic: 12186 Message: 12186

So, as I began to touch on in my S-meter related post, here is a more detailed synopsis of the problem that I'm having with tx'ing on SSB:

The rig functions fine, regardless of settings in AM and FM, as far as I can tell by observation and listening on my little Alinco DJ-G7t. It seems to function fine in SSB when the processor is OFF, with high boost on or off, regardless of mic level (0 to full), even getting "good audio" reports.

The rig will operate fine, with or without high boost, as long as the mic gain is kept from 0 to just under 4. Speaking into the mic gives full ALC range (red bar and a bit beyond) deflection without the processor, and beyond full when the processor is on, and I watch my mic gain.

My problem starts when the rig is in SSB and the processor is on, whenever the mic gain goes above just under the 4 mark.

Once I go above just below 4 with my mic gain - 4 is where the prob. starts to occur, with the problem getting worse and worse as you go up from 4 to full - a kind of "feedback" (I call it this because of the behavior of the problem, not the sound that is produced) begins to occur.

The problem noise maxes out the output power indicator to full (just beyond 100W mark) then backs off a bit, kind of going "shooosh, shooosh, shooosh" over and over about twice or so a second, with a sound that's not unlike the sound of arcing in an air-variable plate capacitor being fed too much power, except that it's more "muffled".

The sound can be heard coming from the radio's speaker a little bit. When I disconnected the speaker from the rig, the sound disappears but the problem remains.

When the problem is happening and I speak into the microphone, the power output / ALC responds correctly, with my voice being heard normally (except for a little distortion) via the MONI with headphones on. I don't have an SSB capable receiver, so I can't hear what makes it out of the radio, but I can see via the meter and hear via the MONI that the noise does seem to make it out of the rig.

Once I stop speaking, the problem returns gradually, taking about a full second to get back to the pinned meter, "shooosh, shooosh, shooosh" level, until I resume speaking.

The position of the processor knob has some bearing on how high the mic gain has to be set in order to initiate this feedback, and how intensely the problem manifests is slightly altered but even with the processor dial at zero, the problem still occurs, just taking a little bit more mic gain to get it to act as strongly as I described above.

I changed mics and there is some difference in the level required to initiate the problem effect, but even without a mic connected, simply engaging the REC/SEND button while PROC is engaged and mic gain just above 4 causes the same thing.

Also, there appears to be a "microphonic" component in the left, rear, upper (I think) section of the rig that causes tapping on the case of the radio in that area to be reproduced in the TX / MONI audio, even when no mic is connected. This leads me to believe that a bad cap somewhere may be the root of this problem, so this has been the initial focus of my (fruitless) initial inspection of the rig so far. Not seeing anything out of the ordinary, (except that the CAR board with the DDS chips on it that is just under the voice synth. and recorder modules, has had some caps replaced, including evidence of minimal corrosion damage having been repaired,) I am not able to further identify any potential cause visually.

I am currently doing some further investigation inside the rig, looking through the various boards a bit more closely, and tap-testing for microphonic caps, and inspecting for any other unusual things. If any progress is made with this, I'll immediately update this post.

I don't know what is going on with this thing.

Like I said, the rig operates OK as long as I'm careful with the mic gain. I can even run the processor, and have been getting good audio reports!

Any help or suggestions for troubleshooting and/or accounts of similar experiences that have since been ameliorated are very much appreciated.

Thanks for having read this far, and in advance for any help that may be provided.

73!
-Rob, VA3GRU.

It sounds like too much mic gain.

Have you set up the radio for SSB Transmission exactly by the book? Especially the Speech Processor since that seems to be where the problem is.

Hi, and thanks for the reply.

OK, now looking at the meter's displayed information as being created by a measurement of how much the AGC circuit is kicking in and not by a direct sampling of how many uV/S-units of incoming signal make it into the front end from the antenna, I guess my question should now be: why, if the S-Meter reading is created by measuring how much the AGC circuit is being engaged instead of measuring the raw incoming signal, is there a position on the AGC selector that makes it so the receiver's ability to measure the incoming signal gets disabled? ...especially with the AGC is disengaged!! Wouldn't it make better sense to have a circuit at the OFF position that lets the s-meter measure how much / how strong of an incoming signal appears at the front end independent of AGC action?

Topic: 12186 Message: 12191

I forgot to add:
-Adjusting the POWER ring behind the MIC GAIN dial does not have much effect on the problem, except to decrease the power being output while the noise is occurring.

-One of my first tries to fix this was to eliminate RF feeding back. So, I grounded, toroided, torroided again, grounded again, my power, mic, cw key, etc., removed everything but the power, and antenna wires which were toroid-encrusted and (power, anyway,) only 10" long from ps52 to rig... and, the problem still exists even with dummy load.

-My antennas match 1.5 to 1 (75 ohm coax) without tuner, almost across their entire respective band (20 + 40) and match totally flat with the tuner throughout their respective band and on others.

-I've pretty much isolated the microphonic cap to the area around the voice synth. / recorder / CAR board area, near the rear left of the rig. I will update this post as soon as I find the component responsible.

Thank-you very much for the responses I've already gotten!

73! -Rob, VA3GRU.

Hi. The mic gain works like normal when using the processor. Mic gain is disabled in FM mode only.

A basic question? Put the radio on 20m into a dummy load and set to CW mode. Adjust the Pwr and Car knobs to max. What is the power out? It should be 100-105w. If so back off the Car control and watch the ALC meter. It should be at max ALC range at abt 12 o'clock and the power should still be 100w.

Rob,

The problem is the meter works off the agc voltage so if you switch the agc off, the meter will not read sensibly. The only reason the S meter has the characteristic that it does, in terms of deflection for a given input signal strength, is because of the closed loop characteristic of the rf/if stages and the agc system. Switch the agc off and you would be running the full gain of the RX into the meter essentially. You would then have a different reading for a given rf input signal with agc on or off. More importantly the range over which the meter would work would be tiny. It's characteristic would be pretty linear with agc off and logarithmic with agc on.

Agc is switched off in FM mode and the meter is operative but driven differently, its deflection law is totally different from that which you see with agc on. In AM, with agc on, my 850 requires 20mV for 60 over 9, whereas in FM the same deflection is achieved at just 18uV. You could do some mods to the set to have the S meter on when the agc is off in AM and SSB but it's not going to be very useful because of this.

Kevin

Subject: [TS-850_450_690] Re: S-meter does not work in AGC-off position?!?

Hi, and thanks for the reply.

OK, now looking at the meter's displayed information as being created by a measurement of how much the AGC circuit is kicking in and not by a direct sampling of how many uV/S-units of incoming signal make it into the front end from the antenna, I guess my question should now be: why, if the S-Meter reading is created by measuring how much the AGC circuit is being engaged instead of measuring the raw incoming signal, is there a position on the AGC selector that makes it so the receiver's ability to measure the incoming signal gets disabled? ...especially with the AGC is disengaged!! Wouldn't it make better sense to have a circuit at the OFF position that lets the s-meter measure how much / how strong of an incoming signal appears at the front end independent of AGC action?

TNX AGN, 73! -Rob, VA3GRU.

Any help with potential causes or troubleshooting suggestions are very appreciated. There are a couple of other quirks with this radio as well: When I tx without processor, with or without high-boost, everything is fine, mic gain dial set anywhere from 0 to full. However, when I tx with my Proc. on, I can't turn my mic gain up beyond 3 (10 o'clock position) or a weird sound - not unlike the sound arcing in an air variable capacitor makes when a tuner is being fed too much power - invariably results. My first investigations were to rule out arcing.

You say 75 ohm coax what kind of 75ohm coax are you using? Most RG6 coax's are made for TV reception to RF transmission at the 100W level since the shield is aluminum it is hard to get the shield grounded properly. Try 50ohm coax since that is what the radio output is designed for.

12197. YM66312 chip from China

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-06-13 15:07:46 UTC
From: va3ut
Topic: 12197 Message: 12197

My 850 has a problem with the DDS chip and I was checking if I can find a part on-line. I came across with some Chinese chip vendors and few of them claim that they have this part but none of them wants to send any picture of it. I am wondering if it is safe to order from these vendors.

Thanks.

Chris AD1AD (ex. VA3UT)

Roland... many antennas do not match 50/52 ohms - so whether the antennadoesn't match, or the coax doesn't match, it makes no difference - the radio's output doesn't see 50/52 ohms, but it doesn't have to see 50/52 ohms - it can see anything from 20 to 200+ ohms, so changing the coax from 72 to 52 ohms will do nothing but slightly re-shift the feed impedance - that is why tuners are built in- it will still need to be matched. There is no reason to believe that there is a ground problem with the aluminum shield.

From: Eric
Topic: 12197 Message: 12199

I've made inquiries with a number of Chinese venders and several also claim to have the chips. But something about the E-mail exchanges made me suspicious. I couldn't put my finger on it, but I decided NOT to order from them. My recommendation at this point is to find a parts radio with the newer chips.

Hi,

Does anyone have a CAR board from a late serial number 850? I can buy the entire part radio if I have to.

Thanks,

Chris AD1AD

Get more info , go through the motions of buying and hold off at the last moment .
Then pass any info back to the group .
There is no way to say anything , about no info , link etc.
Give us something to go on ?

Topic: 12186 Message: 12202

Hi, Roland.

I am using quad shield copper braid rg6 coax. I find that for the price, and since I'm using dipole antennas which have an impedance at the feed point of 73 or so ohms, anyway, It works very well. As I said, my 50 ohm radio matches 1.5:1 without the tuner, so 75 ohms : 50 ohms, and 1:1 with the internal auto-tuner engaged, so turning the 50 ohm connection at the radio into a 75 ohm connection.

Like I had mentioned before, though, since the problem still exists even when I'm using a dummy load connected to the radio with a piece of 50 ohm RG214 (basically 213 with two shield braids instead of one) about 3 feet long into a dummy load.

Thanks for your reply.

73! Rob, VA3GRU.

12203. Re: S-meter does not work in AGC-off position?!?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-06-13 22:00:03 UTC
From: va3gru
Topic: 12182 Message: 12203

Thanks to you and all who have replied! Now I know how the S-Meter's deflection is generated and that it's being totally disengaged in AGC OFF mode is no problem, but normal (albeit counterintuitive) operation of the radio.

OK, Kevin: I see that by adding a mod that simply "taps" the front end would give a linear scale reading with little variance, but one could then create a rather simple circuit to allow for this to create logarithmic output, similar to what is produced by the AGC-based S-Meter, via an additional independent (PIC-based, maybe??) circuit?

I also see that since in FM mode, AGC is not used to measure the signal and the AGC OFF position allows for S-Meter operation, to implement such a mod would be more complicated than just adding this circuit to the AGC OFF position. I suppose one could create a bypass circuit that disengages the mod circuit and returns the AGC OFF position to use by the FM side of the rig...

Anyway, it certainly is beginning to sound far more complicated than anything I think I would try and attempt... maybe someone a little braver and with test equipment should have at it! ;-)

I do still wonder why Kenwood thought people would not want to see signal strength in SSB or AM reflected on the S-Meter when the AGC selector is in the OFF position?

Thanks to everyone who has replied!

73! -Rob, VA3GRU.
--- In TS-850_450_690@yahoogroups.com, "kkyahoo" <kkyahoo@...> wrote:
>
> Rob,
>
> The problem is the meter works off the agc voltage so if you switch the agc off, the meter will not read sensibly. The only reason the S meter has the characteristic that it does, in terms of deflection for a given input signal strength, is because of the closed loop characteristic of the rf/if stages and the agc system. Switch the agc off and you would be running the full gain of the RX into the meter essentially. You would then have a different reading for a given rf input signal with agc on or off. More importantly the range over which the meter would work would be tiny. It's characteristic would be pretty linear with agc off and logarithmic with agc on.
>
> Agc is switched off in FM mode and the meter is operative but driven differently, its deflection law is totally different from that which you see with agc on. In AM, with agc on, my 850 requires 20mV for 60 over 9, whereas in FM the same deflection is achieved at just 18uV. You could do some mods to the set to have the S meter on when the agc is off in AM and SSB but it's not going to be very useful because of this.

>
> OK, now looking at the meter's displayed information as being created by a measurement of how much the AGC circuit is kicking in and not by a direct sampling of how many uV/S-units of incoming signal make it into the front end from the antenna, I guess my question should now be: why, if the S-Meter reading is created by measuring how much the AGC circuit is being engaged instead of measuring the raw incoming signal, is there a position on the AGC selector that makes it so the receiver's ability to measure the incoming signal gets disabled? ...especially with the AGC is disengaged!! Wouldn't it make better sense to have a circuit at the OFF position that lets the s-meter measure how much / how strong of an incoming signal appears at the front end independent of AGC action?

Any help with potential causes or troubleshooting suggestions are very appreciated. There are a couple of other quirks with this radio as well: When I tx without processor, with or without high-boost, everything is fine, mic gain dial set anywhere from 0 to full. However, when I tx with my Proc. on, I can't turn my mic gain up beyond 3 (10 o'clock position) or a weird sound - not unlike the sound arcing in an air variable capacitor makes when a tuner is being fed too much power - invariably results. My first investigations were to rule out arcing.

Topic: 12182 Message: 12204

Hi, Clif:

I get about 110 watts out at just before 12 o'clock into a dummy load.

There is no problem in CW, AM or FM, as far as I can tell, using my HT as the receiver. Problem exists only in SSB mode, when mic gain is above 4 and processor is on at any level, with or without high boost. There is also a microphonic component somewhere in the rear left of the radio, in the area of the CAR board. From what I see, the caps on the CAR board have all been replaced. For that mater, my 850 is a 60 mil + serial number, so if I recall correctly both the DDS chip and leaky cap problem(s) should not be affecting it! The DDS chips are the newer number ones, so either someone preemptively changed the caps needlessly, or it is a CAR board from an older 850...

Anyway, thanks for the reply!

73! -Rob, VA3GRU.

12206. I Need A Kenwood TS-850S Service Manual

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-06-13 22:45:40 UTC
From: va3gru
Topic: 12206 Message: 12206

Hi. I need a copy of the Kenwood TS-850 Service Manual in hard copy paper form or a .PDF one that has good, high-resolution schematics. One that's text-searchable is preferred but legible schematics are necessary.

I have found some and downloaded them from various sites, but they all have had very poor quality scans of the schematics that were impossible to print and put together into a reasonable approximation of the original. Even if I could get a better scan of the schematics alone, I could make due.

Please get in touch if you happen to have a spare hard copy one you don't need that you would part with for a reasonable price, or if you would be willing to do a good, high-res scan of yours, including the schematics: I would be *very* grateful.

I have seen them on ebay from time to time, but they are asking an arm and a leg...

Thanks & 73! - Rob, VA3GRU.

> There is no problem in CW, AM or FM, as far as I can tell, using my HT as the receiver. Problem exists only in SSB mode, when mic gain is above 4 and processor is on at any level, with or without high boost. There is also a microphonic component somewhere in the rear left of the radio, in the area of the CAR board. From what I see, the caps on the CAR board have all been replaced. For that mater, my 850 is a 60 mil + serial number, so if I recall correctly both the DDS chip and leaky cap problem(s) should not be affecting it! The DDS chips are the newer number ones, so either someone preemptively changed the caps needlessly, or it is a CAR board from an older 850...

Topic: 12197 Message: 12208

I have bought some things from Chinese vendors and so far so good. Some of their stuff is pretty cheap, so I figured I wouldn't be out much if I didn't get it.

I buy lottery tickets, but never get anything from those :-) 73
Tom W7WHY

I've made inquiries with a number of Chinese venders and several also claim to have the chips. But something about the E-mail exchanges made me suspicious. I couldn't put my finger on it, but I decided NOT to order from them. My recommendation at this point is to find a parts radio with the newer chips.

I'm in the electronics manufacturing business. These non-franchised distributors are what is known in the business as "component brokers".

Some of the component brokers carry inventory of difficult to find parts but many do not. When they receive an inquiry from someone (you) looking for a part then start looking. The legitimate ones have extensive contacts in the business and will test and verify the parts they find before they send them to you.

The illegitimate ones, MOST of the places you find when you Google a part number as you did, will find some parts in the same package style and remark them. What you end up with is a large quantity of VERY expensive counterfeit parts and no way to recover your money. Counterfeit components is BIG business in certain parts of the world such as China.

This part specifically? It was custom made for Kenwood. If Kenwood is out of parts the only ones you'll find are counterfeit or ones removed from boards. It's highly UNLIKELY you'll find parts removed from boards because (1) there is a VERY limited supply of boards and most get sold as whole boards, (2) there is no market for these parts other than the ham radio community and that market isn't worth the trouble.

I have successfully connected my 450s to my laptop with a cat cable. I have control of the radio with the computer usinf HRD. My question: When transmitting psk31, can I transmit the sounds to the radio through the cable, or is the radio's mike the only way to get the tones on the air? So far, I have not found a menu option that lets me do it.

For PSK31 you need to do it through the mic jack or the the 13 pin acc2 jack on the back.

If I remember correctly, I go the impression that one of the chips is only used for FM. I'm sure that Clif could validate that.
If so, then you should be able to pull the FM chip and re-use it somewhere else...

I use the ACC2 jack as the audio comes in after the mic gain pot so the audio level is controlled entirely by the computer gain setting. This also leaves the rig ready for normal (voice) operation at any time.

DDS IC's functions;

IC1 is the VFO
IC2 is the Het Osc
IC4 is the Car Osc

These three are required for the radio to operate. Realize also that the DDS IC's are 2 parts. For some of the above they operate on one frequency for rx and a different one for tx depending on mode.

IC3 has 3 functions depending on mode.
In SSB it generates the Monitor Carrier for the Monitor function to work
In CW it generates the CW sidetone that is heard in the speaker
In FM it generates the Sub-Audible tone for repeaters

As you can see the radio will function without IC3 but missing some capabilities.

From: john
Topic: 12222 Message: 12222

Hi. I got a ts-450s in a trade that has a pll problem with it. Here goes. The radio will show a 50MHZ read out on the display then it will beep the UL will the pll is unlocked. But the radio will beep when you first turn it on even if you are in the ham bands 10-160 but you don't get the dot's in the ham band..But the big thing is 50MHZ on the read out??? How did they do that???
The radio works on TX and RX but the RX is also abit low and if you let it sit for 10min or so the RX comes up.
Now I have looked at the radio for mods and I see that a mod was done to it and I think it's D27 that they cut but on the front and not the back.
I seen that on pin 9 of the IC7 just above D27 has a cut in it but I don't know if this was done from Kenwood or not and I can't find a good service manual to tell me so.
Does anyone know if this was done by Kenwood or if the person that did the mod sliped and cut it and didn't know they cut it and could this be the problem why i'm having my PLL problem.. I will post a pic of it so you all can see whay i'm talking about.
Thanks for any help.

12223. 450s self oscillates USB, LSB, CW, AM, FM when transmitting, even on dumby load.

From: Daniel
Topic: 12223 Message: 12223

Hello all,

I have had this problem for about 6mo to a year now.

My 450s makes an oscillating type sound when transmitting any mode antenna or dumby load.

I have searched the net high and low with very few helpful results.

I did find two results that a friend of mine seems to confirm as possibilities.
1: Try retightning the screws on the standoffs for the different boards?
2: The caps in the final output have gone bad?

Sombody else seems to think the bios needs to be realligned?

Any thoughts would be appriciated. I'm fitting not being able to chase DX.

Station is as follows:
-TS 450s
-MFJ Adjustable Regulated DC Power Supply (MFJ-4035MV) works fine for my vhf and uhf mobiles
-Maple Leaf G5RV mini

Topic: 12222 Message: 12224

It doesn't have a problem other than being improperly modified.

The 450 and 690 use the same digital unit and a jumper is the difference. Someone cut the wrong thing and now your 450 thinks it's a 690 but shows PLL unlock as the 6m circuitry is not there.

On the low rx replace the leaking cap on the IF unit (C104) and clean the mess off the board and from under the components. It will just get worse and be harder to clean later. Plus destroying traces and thru holes.

Clif

I found that there was another chip that looks like it has been replaced its on board number X50-3160-00 and it is IC2 the number that is on the chip is 66312 I don't know I this is the right chip for there.. When I look this IC up in the service manual I do t see it listed for the 450 but do see it listed for the 690..

Dan,

Make sure you don't have a bad power supply. Try a different power supply or run off a battery to look for the problem.

Good luck.

73,

Tom AF8P

Subject: [TS-850_450_690] 450s self oscillates USB, LSB, CW, AM, FM when transmitting, even on dumby load.

Hello all,

I have had this problem for about 6mo to a year now.

My 450s makes an oscillating type sound when transmitting any mode antenna or dumby load.

I have searched the net high and low with very few helpful results.

I did find two results that a friend of mine seems to confirm as possibilities.
1: Try retightning the screws on the standoffs for the different boards?
2: The caps in the final output have gone bad?

Sombody else seems to think the bios needs to be realligned?

Any thoughts would be appriciated. I'm fitting not being able to chase DX.

Station is as follows:
-TS 450s
-MFJ Adjustable Regulated DC Power Supply (MFJ-4035MV) works fine for my vhf and uhf mobiles
-Maple Leaf G5RV mini

Dan,

I am in complete agreement with Tom as this has happened to me with my Kenwood TS-2000. I was using a Kenwood PS-430 and it is too small in the amp supply department and was told about my poor audio and signal. Switching to a Kenwood PS-50 cured the problem and I am hoping the use of the PS-430 did not damage it!

73 Rod KB8DNS

Also make sure your mic batteries are not depleted!

Make reference to message #12205. This is almost the exact same problem as I am experiencing. The only difference in #12205 is he experiences the problem only when he has speach compression engahed. I experience the problem anytime I transmit, any mode.

Also regardless of what power setting I set the radio at, this problem occures.

I will be taking radio and power supply over to my friends place this Wed. to begin trouble shooting.

More talks on phone tonight.

Describe this oscillation a lot better. Does it make a noise? Does it drop out of tx mode and then go back into it? Since you don't have an ammeter on the supply you need to rig up or use a supply so you can measure the current in tx.

I also use an ameritron atr-8 antenna tuner; but, as I said, this even happens when on an dumby load.

The sound is best described in message #12205. It's like a swooshing sound and a continous tone. This is the best way I can describe the sound.

Refer to message #12205. He has almost the same proboem I have, except his only hapoens when he has his speach processor on. Mine happens in transmit, any mode, reguardless of the processor being on or off.

I do have separate amp and volt meters on the front of the power supply.

The rig does not seem to drop out of transmit.

Message #12205 also describes the "oscillation" sound very well.

12239. Behavior of notch control on TS-850S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-06-27 05:47:32 UTC
From: kbmeier
Topic: 12239 Message: 12239

I got a TS-850S about six weeks ago, and I am having a great time with it. The one thing that seems strange to me is the behavior of the notch control. When I have it engaged, it seems like the notch is very wide. It drastically changes the tone of the received audio. I had it in a friend's shack shortly after I got it who was able to connect it to RTTY software on his computer so we could use the waterfall to look at the behavior of the filters. He commented that the notch seemed very wide, but on his two rigs, one has an automatic DSP notch, and the other has no notch at all, so we didn't have anything to compare to. I don't remember how wide it was, but the stripe it left was about a half inch wide on a 6k wide waterfall, so I would guess at least a few hundred hertz.

So, the question is, on a TS-850S, should I expect to have the notch cut most of the highs/mids/lows depending on where it is centered, or should it be less noticable than that?

12240. Re: [TS-850_450_690] Behavior of notch control on TS-850S

Yes, I have noticed the same thing. As a result I don't use the notch on the 850 a whole lot. I have never seen a mod to narrow the notch but it may exist. Has anyone seen a mod like that?

I had a similar problem but theradiomaybe is a ts-850, while running the display went black without providing more 'any information. The cause of 99% was the capacitor c18, is welded behind the display board, by what I remember, you'll find 3 electrolytic capacitors need to check the continuity on the slopes of the board, often with time is altered. dismantling of the display is quite delicate and find an inverter circuit, within the display there is a fluorescent tube or something like that , but that is not the problem, repeat on ts-850, the display is dimmed to 99% causes the capacitor C18 and the ski worn that does not damage the circuit continuity.

12247. TS-690 Side Band Fliters

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-07-10 17:21:39 UTC
From: Thomas
Topic: 12247 Message: 12247

I have a Kenwood TS-690 and would like to install a sideband filter,
after checking the owners manual it says I have two to choose from,
Yk-88S-1 and The 88SN-1 I have a 90 foot folded dipole up 30 feet on all ends, living in the city of Chicago I always has a noise floor of 7 s-units, which of the two filters would help we with the noise floor, were and when and how would I use each filter and how do I test them to see if there are working,

YK-88S-1 has a 2.4 khz band width
YK-88SN-1 has a 1.8 khz band width

Thanks Thomas N9IHZ

From: Bob Naylor
Topic: 12247 Message: 12248

I thought the YK-88S-1 was a 2.1. Maybe I'm wrong. The other one"YK-88SN-1" is a 1.8 and will lower the noise floor more but you may not like the audio since it sounds pretty "tinny"
Unfortunately the only way to see what works best for you is to try them. Too bad they're not cheap.
I will say one thing, for contesting, the 1.8 will be better.

Well what a surprise, after opening up the bottom cover of my TS-690-S
there were two filters, a YK-88S-1 and YK-88-SN-1, I bought this radio brand new in the box but I dont recall getting the filters, what do I need to do to turn on the filters and would the YK-88S-1 be 6k on the filter indicator and the YK-88SN-1 be 2.4 k on the filter indicator

Thanks Thomas

Thomas, check the instruction manual, there are menu settings for
activating the optional filters at 8.83 MHz(what you have) and 455kHz.
You can download a manual from Kenwood if you can't find yours.

You could put the yk88s-1 in the "SSB" position, and the yk88sn-1 in "CW."

However, to lower your noise floor more effectively, it might help to
try things like repositioning your antenna, or feeding your speaker
audio through a DSP or other filter that offers "noise cancellation."
I can't recommend a particular brand, perhaps you have local ham
friends from whom you can borrow & test.

I know on the 850 there's little switches near the filters that activate them. Not sure about the 690 but 99% of all radios from that era work this way.

Hi Thomas,
Look on the instruction manual and it will explain how to activate the narrow filter using the menus. And yes-it will show 2.4 k on the filter indicator. I have the same with my TS-450SAT, except that I installed a 2.1 KHz INRAD filter.

Hi All

My TS-450 just turned up its toes and died.

I was listening to it and all of a sudden, it sounded just like it didn't have an antenna hooked up any more. No receive or no transmit either - just a lot of white noise like a radio without an antenna.

When playing with some of the controls, the IF shift made no diffence in how the radio sounded. Usually, it goes from a lower to higher pitch when turning the control.

All the filter indications seem to work and the red transmit light comes on, but nothing happens. Maybe that's the end for this good old radio? 73

It sounds like the same issue that I had with TS-850S. This must be a notorious DDS chip failure. Try AM reception by tuning to a broadcast station. If it works but you can't hear anything in SSB mode, one of four DDS chip in the CAR board died. This particular chip is used for SSB product detector, so the VFO works as well as AM or FM reception but no transmit in any mode. I don't know how it affect the transmitter, that was what I got when it happened. I am no expert, though.

450 and 850 use the same DDS chips, and these chips are nearly impossible to get unless you salvage from another CAR board. You either can sell it as a part radio or use it as a nice AM receiver. If you like the radio, then you can just keep it for future repair.

All of a sudden my TS850 is acting up...

Thank goodnes I though to try a CPU reset..

symptoms

1) the meter button works
2) the filter buttons do not work
3) autotune works, but when it drops out, the ALC "pins" and drops to zero over a few seconds
4) mode switches work

the function keys do not work

slope tune does not appear to work.

the m.ch / vfo.ch works.

af/rf gain works

Any thoughts on what happened ???

Hi Paul,
It is on page 81 in my manual for complete instructions. Yes-you need to turn on this filter to get it to work. With the radio off, press and hold the ENT key and turn on the power. This takes you to menu settings. Turn the M.CH./VFO CH control to menu no. 02 for your new filter. Press the UP or DOWN key to turn on no. 02. Press the CLR key to exit.

Note the display will say 2.4K even though the filter bandwidth is
1.8k.

Hope that helps. 73s, Scott, N6CIC

12268. TS-850S Memory Channels

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-07-26 08:38:32 UTC
From: Geoffrey
Topic: 12268 Message: 12268

Hi,

I have fully reset my FT-850S to clear the memory channels.
I pressed A=B while turning the power on.
It seemed to clear everything and bring back the radio to its factory default settings.
However, when I go through memory channels all the channels are empty except channel 10 which shows a number "8".
I have tried to clear but no avail. I have tried to reset several times but still channel 10 shows "8".
Does anyone have experienced same problem? Is there any way that I can clear the number "8"? I can overwrite with a frequency and save the channel but can't clear the number "8".
Any comments would very much be appreciated.

Thank you.

Yes you have to turn it on.. It tells you in the manual on how to do it.. I think it's enter and power on the radio at the same time but look in the manual it's page 81 of the manual

Bob,

I don't remember exactly, but figure a watt or two, at 4-8 ohms.

Bob,

According to the TS-850 manual it is: 1.5W across 8 ohms load (10% distortion)

Thanks Ken. Here's the reason I asked.

The CW side tone is low even though I have it turned all the way up. I had this issue with a Kenwood TS-50 years ago.

When I was mobile I ran the audio through the stereo so if the volume was set low on the TS-50, the stereo would then be turned up which would make the CW side tone nice and loud (ratio of audio to side tone level). Since my TS-850 and my old TS-50 has a set side tone level (no matter where the AF volume is set) using an external audio amp, in this case the stereo, allowed me to change the "ratio" of audio to side tone level.

At home I like my kenwood speaker so I thought of building a small audio amplifier which would drive the speaker. This would allow me to do the same thing as I did mobile years ago with my TS-50 but I needed to know how many watts the audio amp has.

I remember reading several years ago about building a small 1 watt audio amp which was designed for HT use in a vehicle. I think it was just one "chip/IC" with a few external parts. Maybe I can do something like this? Also, since the side tone level is low, using this 850 at field day with a speaker makes hearing the side tone tuff. This may solve that problem also.

Hope I explained this clear enuff.

Bob,

I understand the situation. I no longer have an '850 but if I did I would consider a mod to make the side tone level adjustable. I recall reading about a mod (or two) that enabled you to adjust the side tone level in CW mode with the "MONI" knob on the front panel. Do a search of the 'net and I'm sure you will find a mod. I don't recall that they were too involved. It might be a better solution than building a small audio amp.

Ken, I have looked into that but I was told that it would not be any louder, only adjustable. I have since researched it finding no info on becoming louder. Maybe someone knows different?

12276. TS850 MC60 Modulation problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-07-29 10:48:38 UTC
From: m6gbt
Topic: 12276 Message: 12276

Hi
Having a problem with my modulation coming through the rig speaker when using my MC60 Mic.

Checked the known problem of reversed wires on the mic head, this is OK

Fitted a ferrite clip on the cable near to mic socket on rig

Moni button pressed both in and out, with control right off

Is there anything else I can try to sort the issue?

73, Thanks
Pete

12277. TS450 TX / RX Alignement

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-07-29 14:10:34 UTC
From: isabelle.fourias
Topic: 12277 Message: 12277

Hi,

My 450 is transmitting about 200 hertz lower than is indicated on my radio readout.
Same issue on RX, I have to put +/-200hz above the initial freq, for receiving on the right freq

Does anyone know how I might adjust that, or calibrate it back to on
frequency ?
It can be done temporarily via the XIT / RIT adjust controls on the radio, but I'm trying to calibrate that "zero" setting up 200 Hz

Any idea ? or Should be possible via the menu ?

Thanks, Mark

Pete,

What happens if you use a different mic?

If, while using the MC-60, you connect your rig to a dummy load instead of an antenna do you still hear yourself in the speaker? If you have the monitor turned off and you hear yourself when connected to an antenna but do not hear yourself when connected to a dummy load it suggests there is RFIin your shack. Are you sure the antenna cable connectors are tight a the
ends of all cables from the rig to the antenna (including SWR/Watt meters, tuners, switches, etc.)?

Mark,
See the Display Calibration adjustment on page 80 (Section 6-7) in the Operating Manual. Requires a jumper wire to be installed from one side of the rig to the other. This jumper was included as an accessory with the rig when new. If you don't have it, a simple wire with appropriate ends to connect to pin test points will work.

Good luck & 73

12281. sub or workaround for a dead or iffy ym6631? a serious question.

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-07-31 15:31:53 UTC
From: Doug
Topic: 12281 Message: 12281

Many of us have parted out or trashed one of these models just because replacement ym66312's are MIA. They are reliable radios and sweet to operate except for this BIG weakness. Sellers on various sites generally don't report serial numbers or DDS part numbers when posting for-sale ads, so buying one can be hairy.
Has anyone found a sub or workaround for a dead or iffy 6631 and have you tried it and thoroughly tested it? If so, the dead would come to life around the world.
Is anyone close to a solution?
ThanksDoug k7kw

Topic: 12281 Message: 12282

I have tried to solve this situation too. In my case the YM6631 died in TS450, although most information about died DDS came from TS-850, I solve it finally with replacement by the YM66312, bought last for high price. Offers from China seems all to be "fake" or non serious.
It is very interesting, that I have read somewhere, that there is a newer version of the YM66312 DDS used in the TS-870 programming compatible, but it should have different package. I have not seen anybody who did it and how, if there should be some "adapter" for placing this chip into the original PCB, or if somebody designed the whole CAR board as replacement on the connector level.
If somebody has more info, I am very curious too, how it was solved.
Regards,
Vojtech, OK1VAW, Prague, Czech Rep.

12284. TS-850 Battery Mod

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-08-05 01:14:48 UTC
From: John Parker
Topic: 12277 Message: 12284

Aloha everyone,

I started taking my TS-850 apart to replace the front cover which was in bad shape.

Now that I have everything open, i might as well remove the old battery and install a holder and battery.

Has anyone done this? I see references on the web and references to battery holders are 7 years old and part numbers are no longer correct.

Does anyone have a current source and part numbers so I can order and move forward with this?

73,

John WH6DQU

I used the holder from radio shack 270-009 and a CR2032 battery. I also moved it back and placed it under the hinged lid on top of the radio where the DRU-2 would go.

Hi John,
I made changes to both my 850 and 870.
It is really simple. Go to your nearest Radio Shack and pick out a replacement battery, and along with that, purchase one of their battery holders for that battery. Then use some small wire, two different colors and tack solder them where the batteries were connected. reassemble the front panel and mount the RS holders in an open area, solder the wires to the appropriate terminals on the RS holder, and then insert the replacement battery.
Locate the holder so that it won't touch anything to short it out.
There is a mod for this that shows some specific places to mount or place the replacement holders.

All you have to do to replace batteries next time is remove a cover.

Aloha everyone,

I started taking my TS-850 apart to replace the front cover which was in bad shape.

Now that I have everything open, i might as well remove the old battery and install a holder and battery.

Has anyone done this? I see references on the web and references to battery holders are 7 years old and part numbers are no longer correct.

Does anyone have a current source and part numbers so I can order and move forward with this?

You can pick up battery holders for the CR2032 batteries at Radio Shack. If you want a lower profile holder, google CR2032 battery holder. They aren’t expensive.

Frank, WB4CIW, that's the way I replaced the battery holder in mine. I think the total was about $6. and now I can replace the battery in about 5 minutes if need be.

Aloha John,

When I had my 850's I always got the 'Coin Cell' holders at Radio Shack along with the coin cell batteries and a piece of perfboard. I had also done a few other 850's for friends it is very simple.

I guess I'm having a hard time understanding the logic behind replacing a solder in battery which has no contact issues with a holder which can have contact issues. I know everyone says it makes it easier to replace the next time but the next time is usually about 20 years down the road.

I guess some don't want to take the chance of the battery leaking and damaging the circuit board.

12297. Used TS-450SAT Check List?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-08-06 14:56:51 UTC
From: yankee495
Topic: 12297 Message: 12297

Hello everyone,

I purchased a TS-450SAT from Ebay...I know, very risky.

http://www.ebay.com/itm/231024689533

I also bought a Tektronix 468 100 MHz Oscilloscope and HP 5334B 100 MHz frequency Counter. Both of them are in great condition, cosmetically and functionally. I also have a watt and modulation meter. I hope I get that lucky with the 450 because then I'll be done for awhile.

I don't have a callsign yet but on August 24, 2013 there is a hamfest in Joplin, MO. and I'm 15 miles east of there and am going to take my test there. I've taken it online and passed it. I also took the General and passed it 2 out of 5 times but only by the skin of my teeth. With the "wrong" set of questions I'd fail the General at this time.

About 17 years ago I was going to take my test and never done it. I had bought an old radio and it was stolen from me just before I was going to take the test. I had a local ham helping me and I was really up on things. It is amazing what you forget when you don't use it...I know age has nothing to do with it....hahha...I'm 48 now. The 24th is also my birthday...gifts welcome, hahahaha. Really it is.

I have a couple of friends who are hams who can help me check out the radio here in town.

Since I can't use it for a couple of weeks I'm going to have them go through it with me to show them how to use the test equipment. I don't think they're up on that stuff...more appliance operators...new radios that work (IC-7000's) and they don't work on them.

Ok, so I know I need to check the tuner, battery, output/modulation and bands...receive on beacons etc, display accuracy, frequency stability, memory, and overall functionality of knobs, buttons etc. Also visually check capacitors for leakage and make sure it is all there of course.

What other things do I need to check? Any common faults? I know about the dot problem but have read the 450's don't have the brown glue. I almost bought a 440 with the dot problem but it was listed as having the dot problem fixed that came back. I knew this could be an adjustment but not knowing what was done to try and fix it...I passed it up.

I hope the radio just works and it is more of a visual inspection and not a troubleshooting nightmare. I went ahead and bought a radio instead of looking at the fest because everywhere you look people are pricing things based on Ebay prices. I know I may have gotten a deal but like with the scope and counter I just bought them because I had hunted for about 2 months and I could bargain hunt for the rest of my life and never own one.

I paid about $550 with S&H which is what the sold listings show for a decent condition radio. I'd say the condition of this one is very good to excellent if it works as good as it looks. I just don't think a really good radio is going to go for $300....more like $450 and I wasn't going to fiddle around for 6 months to save $75.

My debit card is set up to where you can't spend more than $500 in one day without phone approval for security reasons. I usually just withdraw the cash directly but in this case that won't work. Now I have to call the bank to pay for it. I hope to have it by Saturday...it is in Colorado.

Feel free to express opinions...

Aloha Clif,

The reason I did mine and others here is there are no places in Hawaii to get the original solder in batteries and since they are Lithium they can not be shipped here except by boat and that takes 8 weeks.

Well,

If my memory serves me right, the seller has been known to sell junk!

So, maybe you will get lucky! If my memory fails me then I apologize.

To be sure, google his ebay name & see what turns up!

I bought a heathkit AR-3 off him & it was advertised as working! Didn't work when it arrived!

He didnt answer my emails!
Now, it sits waiting for me to take a look someday!

If I lived on the mainland, i might have done something as shipping is an arm and a leg from the islands!

So, he lost my business!

Hope you have a better experience!

73,

John WH6DQU

Cliff, where does one find the original replacement battery? I did a Google search for it and came up with nothing.

Google either CR2430-FT1 or CR2330-FT1 and take your pick. The CR2430 or 30 is the battery size. The FT1 is the pin configuration.

I'm sorry to hear that John...and his feedback was good and it wasn't until I Googled his real name I found a problem. I tried to Google "radios-n-stuff" and didn't find anything. However his real name brings up unhappy gun buyers as well as radio buyers.

All I can say is I paid with Paypal, and he said used which by definition means it works...as for return S&H I'll file on him in small claims court after Paypal & Ebay rule in my favor.

Maybe he straightened up..but if he left you just "high-n-dry" that doesn't sound good.

Whatever the case it looks like that inspection on receipt will have to be very thorough for certain. If he looked at my feedback, Googled my user name and purchase history he should realize I plan to check it well. Maybe he pawns off junk when he gets it, I just hope this is a good one.

You know, if you have junk sell it as junk...the profits will come from the trust you gain by higher prices on the good stuff. But...crooks don't see it that way.

I'll have to leave feedback based on my dealings with him and the condition of the radio...and fair I will be according to how things turn out.

Thanks for the heads up.

Ebay and Paypal are one in rhe same in my book.

I have been on ebay since 1999 and have seen so many changes. Usually in the favor of the companies, not the individual!

Radios-N-Stuff deals in large volumes/turn over! Ebay/paypal makes a tidy sum from this guy on a monthly basis! They are not going to cut their nose off despite their face!

In other words, odds are in his favor!

At one time, I had a mint 450, I was the second owner! I'm sorry I got rid of it! My goal was to have an 850 which I obtained and ended up selling it! So, within the past couple of years, I obtained another 850 & 870. My dream xcvr is the 950sdx! Problem is, people who own them don't want to sell! So, you have to wait till someone is a silent key!

I suggest that you also try qrz.com for ham items! Things seem to be reasonable most of the time! But beware, they also have hams who will try to cheat you, scams, etc.

In the most recent past, I was scammed by someone who assumed the identity of a ham to advertise the sale if a Kenwood TS-959sdx! I was very lucky and got my money back but I was sweating bullets for a few weeks!

This email reflector is a good source for items as well.

This group is a great source of info and if you do a search for past topics, the 450 was a hot topic for a bit with some really great info as well as what appears to be undocumented info!

All the best!

Aloha

Hello again John,

I've been busy reading the book for the test. It is taking so long because every time they reference a question I go look at it...so far I know them all but it is a great refresher.

I tried QRZ but being new they won't let me reply to ads so no chance of anything there. I also read their guidelines for not getting ripped off but all the hams there want money orders...I guess they haven't read the guidelines.

Of course I don't have a callsign so maybe that is why, I don't know but I can't even carry on a conversation there because the moderator has to approve every message I post so the people there probably think I'm rude. It has been over 2 months so you'd think they figured out I'm not a spammer.

I've read about the scams...stealing a callsign etc. There was a post with a scammer using a phishing page to get passwords the other day. I traced the IP and it was in Czechoslovakia but that didn't stop me from going to the page and entering "Your're" as a user name and "Busted" as a password and when they look at their list of stolen stuff they'll see that.

I have to do something for fun until the 450 gets here and I couldn't think of anything better.

The radio is not shipped YET! He says with in 3 days of payment...packs it second day and ships 3rd day. He should be packing it today and ship by tomorrow.

I'll be glad when it gets here...no shipping damage and works. I'm usually a little more patient but in this case I need to know it works and wasn't drug here behind a UPS truck.

I'll go check out email reflector now, never heard of it, thanks for the heads up.

73's

John (my name also)

12308. Kenwood TS-850 autotuner installation

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-08-17 04:40:13 UTC
From: cclarkkent
Topic: 12308 Message: 12308

Hello everyone,

I picked up a late model 850 last weekend that is in great condition, and I have looked it over and it was the newer DDS chips in it, so no worries about chip failure and I have read over the directions for replacing the battery. I found an operator parting out an 850 and he is sending me the autotuner for this radio. So, I am waiting for my internal auto tuner to arrive in a few days.

My question is, where do all the connections go? I opened up the radio last night and found 2 of the ribbon connections, but as far as the Red banded and yellow banded coax, I see a few them in the PA section. Can someone help me out and give me a description on where they go or even a photo. I hate to hook it up wrong and break something! Spare parts are expensive!

Clark I attempted to send you a copy of Page 70 out of the manual, but wasn't able to send it. Download a copy of the Owners Manual from the Kenwood Site, and it shows on page 70 how to install the AT unit.

Hello Matt,

You can find here in the file section the user manual.
On page 78 is a description how to install the tuner.
Not all of the manuals have this section (my printed original for example has not), that's why I'm posting this.
It's not too complicated :-)
Good luck with your install.

12311. Distorted Modulation on Monitor Listening

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-08-17 18:24:06 UTC
From: k4zot
Topic: 12311 Message: 12311

I have a late serial number 850 and I am experiencing distorted modulation on my 850 monitor listening. I basically understand the reasons for the distortion, but I am interested in other comments. I have a second floor shack with a relatively poor grounding system - 10 gauge wire to an outside ground rod and grounded to the house wiring. Second, my 3 element CC beam is only maybe 35' from my radio at 22' high on a roof mount. So, this is not a good system, but I have to live with it. One major problem is when the beam is pointed toward the shack the distortion appears - overloading the front end. I believe even an improved grounding system might not solve the problem. Any comments?

Thanks,

Glenn

I was thinking this was more complex, in that I was going to have re-route the output, but in retrospect, it looks easy now. I looked in the manual and it was not very descriptive, but then, it does not have to be! I just opened it up and went over the installation location and other then unplugging the a jumper and replacing it with the 2 new connectors from the tuner, and the 2 DIN cables it looks easy.

Now the next question, I checked the battery voltage and it reads 3.289 volts, do I need to worry about that yet?

You have a DC-60Hz ground. Tom W8JI has some tips
for effecting a useful RF ground for a 2nd floor
shack:

Matt, while I was inside the 850s I would replace the battery. I think you can get what you need from Radio Shack. That's where I got the replaement for my 450s.

Hi

It is time to get the TS-850 on the air. But when testing tuning against a dummy load it seems that TX on 40m, 17m and 12m is blocked? No TX, no tuning.
What could be the problem? Some programming to be done? The TS-850SAT is bough in Sweden from a Silent Key.

Hope someone could explain whar to do. Programming, change the diode matrix?

Subject: [TS-850_450_690] TS-860 Transmitt blocked on 40m, 17m and 12m

Hi

It is time to get the TS-850 on the air. But when testing tuning against a dummy load it seems that TX on 40m, 17m and 12m is blocked? No TX, no tuning.
What could be the problem? Some programming to be done? The TS-850SAT is bough in Sweden from a Silent Key.

Hope someone could explain whar to do. Programming, change the diode matrix?

73/SA4CFP

12319. BFO Shifting and CW receive distorted on TS-850

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-08-23 03:16:20 UTC
From: nm9p
Topic: 12319 Message: 12319

Here is an interesting problem that just started on my 20 year-old (1993 - 50 Million series serial number) TS-850SAT.

Background:
I received delivery of my new FLEX-6500 Wednesday and sold my 850 to a friend. Before he picked it up last night I removed the 250 Hz filter in the 8.83 Mhz IF and the 500Hz filter in the 455 KHz IF. I did not put the screws back in the board. I DID change the DIP switches under the top cover as the manual requires.

The Problem:
This evening (one day later) he called me with the following problem:
While listening to a station on SSB (USB or LSB makes no difference), when he clicks the mike briefly, the receive jumps frequency a few hundred Hz. BUT the VFO frequency doesn't change at all. If you click several time, it will jump 2 - 3 times and then return to regular frequency.

Upon further tests, it occurred to me that when it happens, if you retune the station, it sounds like the "passband tuning" has been changed - i.e the BFO injection frequency apparently has changed.

Successive "clicks" and the rig returns to proper frequency, and proper fidelity.

During additional tests I switched to CW mode and found that all of the signals were distorted and sounded more like square waves instead of nice sine waves. switching back to SSB mode, the same CW signals were clean and pure.

Question: Did something happen when I removed the filters?
or is this just a coincidence?

I plan to replace the filters tomorrow and see if it changes anything.

Additional Info:
1) I do NOT have the battery replacement mod, but the battery looks clean, as does the circuit board. But it looks like one of the welds might have become detached from the pin that solders it to the top of the board. I couldn't tell without removing it. I am not sure I want to take on that job.

2) I HAVE reset/restarted the rig several times.... using the A=B + power on routine. Also did the VFO A + Power ON reset.

3) The first time I did the a=b reset, all the sound sounded very garbles and "jumpy, like the VFO couldn't make up its mind what frequency to be on. After doing the MEM A + Power On reboot that cleared up, but the initial problem still was happening.

I need a solution. My Friend is a new ham and longing for this rig.

Thanks for any help you can give.

Ken - NM9P

12320. Re: BFO Shifting and CW receive distorted on TS-850

Topic: 12319 Message: 12320

Updated Information:

After replacing the filters, and loosening and tightening all the screws I could find on the IF board side of the rig, the malfunction is still occurring.

Further testing also revealed the following:

1) When quickly clicking the mike, the shift goes through 3 or 4 different shifts and returns to "normal."

2) When transmitting on USB and listening to myself in the monitor, my voice pitch is raised about 1 KHz, as though I am tuned off frequency. This happens on every transmit, no matter which of the 3 toggles the receive shift is in when I hit transmit.

I didn't check LSB because I didn't think of it. My friend will check it later and email the result. I am certain that it will be shifted the same, or perhaps 1 KHz low.

3) The receive shift doesn't seem to happen in CW mode.
I didn't think to check RTTY mode.

4) After re[placing the CW filters, I note that the CW receive note is pure when the 500 Hz 455 KHz IF filter is in line. But when the .455 IF is set to 12, 6 or 2.7 KHz width, the CW note is distorted and has a two-tone harmonic quality to it. This does not change when changing the filter width in the 8.83 Mhz IF through any of the filter settings - 12, 6, 2.7 or .250 KHz...

My best guess is that the logic board is causing the BFO to cycle through the different offsets that it should have for USB, LSB, CW & RTTY.

Any other info out there?

Thanks, Ken - NM9P

What is the SN of the radio?What is the PN of the DDS IC's on the car board?

Thanks for your reply, Cliff.
Serial number on the rig is in the 50 million series.
I bought it new in 1993 and have never had a single problem with it!
I don't have the rig in my possession right now. It is at my friend's house. But I would assume that the DDS IC's are of the newer vintage.

DO you need me to go over and open it up?

Thanks again. Ken

BTW... He checked for me and when listening to yourself on SSB through the monitor, on USB the voice pitch is HIGH, and on LSB the voice pitch is LOW. like you are tuned wrong...

It sounds like it should have the new DDS IC's. Are you sure you didn't bump the little pots when you turned off the switches for the optional filters? They set the car osc and that sounds like what the problem is.

Topic: 12319 Message: 12324

It is possible that when I used a screwdriver to loosen the filters, which had been in there for 20 years, that I may have bumped something on the filter side.

I was pretty careful when I set the dip stitches. There is not much to that. Which pots should I check? And how do I check them?

I've been a ham a long time, but even 20 year-old surface mount stuff gets a little small for my eyes...

Do the pots set the switching logic that selects various frequencies, or what?

12325. 450SAT Filters

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-08-26 03:27:15 UTC
From: yankee495
Topic: 12325 Message: 12325

Hello all,

I did receive the 450 and it seems to be a great radio. I also went to the Joplin, Mo. hamfest and passed my Tech and General...just waiting to show up in the database now.

Since this is my first real radio I'm confused on filters. I understand what they do but am a bit confused on what is in it and when it does what it does.

There are no optional filters installed in the bottom panel. On the front under 8.83 it lights up Thru/6K and under 455 it lights up 12K/6K/2.4K. All setting do make a difference.

There is an optional YK-88S1 2.4 KHz and a YK-88SN1 1.8 KHz available. I know the 1.8 is the narrow filter better for noise etc.

Why does it indicate 2.4 with no optional filters? Stock? What would be the point in adding another 2.4?

I read about another model KW that you can activate the filters for transmit but I see no menu options like that in the 450. Are the stock filters also used for xmit or is the optional 2.4 for xmit?

The radio arrived looking like new, smelling like new with all manuals, schematics and accessory plugs still in the bag packed in the original boxes that match the serial number...which is 70100048 with an old shipping label dated July 10,1995 and was shipped for $8.77. It does not have the MARS MOD.

As I had mentioned I had planned to take my Tech test on Saturday, my birthday, at the fest, but I went ahead and studied for a few days and passed the Tech and my General a day sooner than I had planned. I was able to pre-register for Friday night. I actually know the stuff and didn't just memorize it.

As I'm sure you know I'm pretty excited and also kicking myself...I should've done this on my 14th bday not 49th.

I've been very lucky with electronics purchases on Ebay...a Tek scope, HP counter and now a radio. I believe it is working like new and I'll stop now.

I've had a great time listening to the guys talk about antennas, mics and radios. I have a Shure 450 desk mic I need to order a plug for. It has the USA made element in it...it is pretty much like the 444.

I'm antenna shopping now...either to build or buy...lots of options especially with the tuner but I understand an external tuner is best.

Just any advice, info or anything else would be great.

One last thing...it tunes 30-40MHz and they say to remove D21 to receive there. Is it not receiving??? and just tuning it? And I read not to remove that diode as it cuts your power

so I'll leave that alone.

Sorry this is so long but I know you can't answer a question without the facts.

12326. Re: BFO Shifting and CW receive distorted on TS-850

The pots tell the the DDS chips what frequency to generate for the car osc.

> > > > >
> > > > > 4) After re[placing the CW filters, I note that the CW receive note is pure when the 500 Hz 455 KHz IF filter is in line. But when the .455 IF is set to 12, 6 or 2.7 KHz width, the CW note is distorted and has a two-tone harmonic quality to it. This does not change when changing the filter width in the 8.83 Mhz IF through any of the filter settings - 12, 6, 2.7 or .250 KHz...

There is an optional YK-88S1 2.4 KHz and a YK-88SN1 1.8 KHz available. I know the 1.8 is the narrow filter better for noise etc.

Why does it indicate 2.4 with no optional filters? Stock? What would be the point in adding another 2.4?

The YK-88S-1 is a 2.1 filter.
Enjoy your new rig!

Congratulations. I hope you will enjoy amateur radio as much as I do. I have a TS850 and I think the 450 is similar. If it has the slope tune, save your money. Use the slope tune and you really don't need the filters on SSB. If you use CW you may want to get a 500Hz filter.

For an antenna, I would recommend the Alpha-Delta DXCC to start with. It includes 80, 40, 20, 15 and 10 meters. It is heavy duty. It will come from the factory cut for CW. For tuning for phone, you do not have to cut it, but you may shorten it by wrapping the wire back around itself as needed. It works as good as any and better than most and fits in a small area. After you gain more experience and radio knowledge you can decide on other antennas. Of course, many hams enjoy experimenting with antenna designs. All said, it is very difficult to find an antenna that outperforms a dipole – maybe a double bazooka. Antenna choice has a lot to do with the size of your property.

I find that the best mic is the one that came packaged with the radio. I know many may disagree with that and the antenna choice, but you asked and I am trying to help you get started successfully. Enjoy. 73

Oh, ok, I got it...the 2.4 is lit because it has a 2.1. I understand now...somewhere it says another indicator will light even though the filter may actually be a different width.

I had seen the DXCC but didn't remember the name. If I could remember everything I have glanced/read or flipped past I'd be way ahead of you guys! Really, I done a lot of research.

I read a lot and am enjoying the tech talk...gives my eyes a break. I know what ya mean about microphones. People think you need a souped up D-104 etc and I see others using $400 mics.

I paid $15 for the Shure 450 and it has a scratch or two but is in great condition as far as a mic that is going to be used goes. I wired it to a SSB CB and people said it sounds great. It is not amplified.

For certain I'll use whatever sounds the best because that is the name of the game. I'd really like to use a desk mic that I don't have to lean into. I'm really tall, long arms and a seriously bad back, so I'd like to kick back to rest my back (one reason reading on the computer kills me).

The 450 doesn't have slope tuning but I have learned to use the IF Shift pretty good. I can knock out interference just two KHz away. It'll do what I need and like you said, as I learn I'll form a better opinion/understanding of what I want/need.

As far as enjoying the hobby there isn't going to be a lack of that! I wanted to do this years ago and life, either the situation, where I lived or finances, something always prevented me from doing it. It got to the point I never thought about it and about two years ago I told my wife I wanted a radio.

Here today, two years later I finally got it done. Now that I've went to the trouble to take the test I won't be without a radio unless the tornado comes back! Near Joplin here.

Thanks again guys and I'll for sure keep you informed and check in to see what is up. I still haven't checked the battery so I guess I better do that. It retains the memories etc but I understand a bad battery can do a radio in.

Make sure you read the posts about the leaking electrolic capacitor on the IF board for ts-450s and ts-690s on the IF board. I think it is C119 the audio bypass capacitor. It leaks over the IF filters and causes the traces to turn black and corrode. It is very important to remove all of the affected components (very carefully) from the board and clean underneath them, especially the 12 and 6 KHz filters. The TS-690s that I bought this year had the problem, little did I know that just cleaning the board made the problem worse and was causing the 6 and 12 KHz and 2.4KHz filters to be switched on all the time. Removing them and cleaning underneath solved the problem.

BTW the INRAD 2.8KHz or 4KHz (8.83MHZ IF) SSB filters make a great addition to the rig. The 6KHz filters are just too wide for SSB work and the 2.4KHz (built in) murata is narrow enough and works with any of the 8.83 MHz IF filters to improve noise. 1.8KHz is probably too narrow unless you are trying to work very weak DX. If you are going to work any digital modes then the 250 or 500 KHz (455KHz IF)INRAD filters are nice to have.

12331. 450S USB off frequency

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-08-28 23:25:45 UTC

First off, I am new to the group and I wish to thank everyone up front for any help you can offer me.

I have done a lot of searching the web and here as well as going over the service manual trying hard to answer my own question before I jumped in here and started asking for free advice. However, try as I may, I can not seem to find a straight answer as to how to correct a slight issue I am having with my TS-450.

It's just a touch off on USB, but LSB seams right on. I compare it to other rigs and receivers on RX and TX and I have to bump the VFO up a bit to line up. I know, its SSB and its not a big deal to be at 14.300.07 -.10 to be right on with the rest of the gang, but for lack of any real good reason to adjust it, it's more or less, because it bugs me.

I found some information in the service manual (page 125-13) but I'm not exactly sure it's what I am looking for.

I would be very grateful if someone could point in the right direction on this subject. Not asking for anyone to solve it, I kind of like doing that, but maybe a clue and some tutoring would be great.

Thank you
Brian

You have to realize the correct procedure is to use a 2-tone generator and a 'scope to set it correctly. That being said if you are careful and patient you can get it done.

That being said, Do you know how to get into the alignment menu? Do you understand how it works?

Let me know. If you don't understand those two things the odds of causing more problems are greater than the problem you are having now.
I will not tell you how to get into the alignment menu.

Clif

From: rzacharkow
Topic: 12334 Message: 12334

Have read some earlier posts but still need some clarification....if I change the cw pitch (menu 40) away from the default 800 Hz, say, to 600 Hz for listening, will the side tone frequency generator change to 600 Hz also or does that remain fixed at 800 Hz (pg 29 on zero beating)?

My concern here is: if in fact the side tone freq. generator always stays fixed at 800 Hz, and I change cw pitch from the default on the menu, then I can no longer accurately zero beat the incoming signal?

The sidetone is fixed at 800 Hz, so adjusting pitch does ruin your ability to zero beat. Actually, I just measured mine with a soundcard oscilloscope program, and mine is about 815 Hz. I leave the pitch at 800 even though I hear better at 600 to 700.

I got it all sorted out, thanks for the help, it was mostly undoing the doings of a magic 11 meter screw driver... It working fine in that area now; I am just down to having an issues with the VOX switch not working along with ATT and Auto/Thru all not working, Send/Rec does work. All the switches test good. I am giving up for the night, but plan on taking another run at it this week end. Any hints and tips would be greatly appreciated.

Thanks

Brian

Topic: 12331 Message: 12339

I just noticed the ATT and VOX switches are not working, I assume this might be part of the reason why the ATU doesn't work. Otherwise, I'm getting most of the way through the radio. Any hints on this circuit?

Thats the last hurdle, the FM is all sorted out now, just down to the ATT/VOX/ATU switch. Send/Rec works, so I am wondering if there is an voltage or ground issue for the switches.

Thanks for the help so far!

Brian

The preferred method for zero beating with the TS-450/690 is to
switch between CW normal and CW reverse with the "rev" button. When
the tone of each matches, you're zero beat with the received
signal. This technique works regardless of the CW Pitch (menu 40) setting.

Hope this helps. 73

I should update I guess. I got a chance to put the radio on the bench at a friends shop. After a few helpful hints and rereading everything, I found the issue and got it corrected. This radio was the victim of the golden screw driver, with the AM cranked up and out of band mod as well, I suspect it was used for the 11 meter band; after getting it on the bench, it all came back into working order. There still an issue with the S-meter when in FM mode and ATU is not working, even after going through all the menu settings, but those issues will be taken care of next time I get some bench time.

The biggest issue was a trimmer and several pots that had been twisted about. Sorting out those and a few tweaks with some setting on 11/13 menu items, all is good.

Thanks everyone! If anyone has any hints for the ATU not working, I am all ears!

Brian

Probably very simple. Go to the options menu. (Hold down ENTER and turn on the power.) If the first item is on then that's the problem. #1 wants to know if you have an AT300, off or no. The AT300 is an external tuner and if you tell the radio on, thinking it's asking about the internal tuner you are wrong. With a on answer the radio disables the internal tuner to avoid a conflict. It is not changed by a reset.

1. Power off
2. Hold down Enter and power on
3. Set #1 to OFF
4. Clear
5 Use internal tuner.

In the manual that I looked at,menu 40 says "The pitch during CW reception can be set anywhere in the range of 400 to 800 Hz in 50 Hz steps" Default is 800. This should mean that your side tone will be whatever you set it at.
When you zero beat, your sidetone should be at whatever you have menu 40 set to.

Bob, unfortunately that's not the case. The CW pitch setting affects the received tone only. The side tone (key down) is fixed at 800Hz regardless of the (received) CW pitch setting (menu 40). And unfortunately, there is no internal adjustment to change the side down frequency. Therefore the only zero beat method available after CW pitch is changed away from 800Hz is to use the 'rev' button as previously described. Once zero beated, the received tone will equal that which you have set in menu 40. Your side down will remain, now and forever, at 800Hz. See the note at the bottom of page 28 in the operating manual.

check the settings on the side of the radio on the vox, when I bought mine, they had the antivox and the other one over there set so it didn't work. I got them to more normal settings and it works fine. It made me think maybe the previous owner didn't want vox to work.

Any fuse I have found so far has been okay.
Something that feeds the cluster of four switched above the mic input. Send/Rec works, but that one just shorts the key line, however, VOX/OFF ATT/OFF AUTO/THRU are all dead.
I suspect there is a feed voltage to these that comes off the push button panel X44-3130-00. I have not had the time to look much farther into it, but with the 3 switches in the cluster are dead. All the switches are good so when I get time, I'll have to trace out and check for voltage.

I'll do some more looking this weekend, make sure the ground is good to the switches.

Thanks for the help!

Gotta thank everyone who offered their thoughts on my question. This is a great group! I normally leave menu #40 on 800 Hz but as i get younger every year, a lower pitch can be easier on the ears! The suggestion to use the REV button to zero is a good one...tried it out today and liked it. My guess as to why the sidetone generator is fixed at 800 Hz, either to keep the sales $$$ down on the 450, otherwise if you wanted the tracking feature then you buy 850 or more upscale model.   --- In ts-850_450_690@yahoogroups.com, <wotbob01@...> wrote: Strange!

That's very strange that it would be designed that way. When you think about it, the side tone is just an oscillator which I'm sure can be modded if you wanted to. Clif, any thoughts?

Gotta thank everyone who offered their thoughts on my question. This is a great group! I normally leave menu #40 on 800 Hz but as i get younger every year, a lower pitch can be easier on the ears! The suggestion to use the REV button to zero is a good one...tried it out today and liked it. My guess as to why the sidetone generator is fixed at 800 Hz, either to keep the sales $$$ down on the 450, otherwise if you wanted the tracking feature then you buy 850 or more upscale model. --- In ts-850_450_690@yahoogroups.com, <wotbob01@...> wrote: Strange!

Bob, unfortunately that's not the case. The CW pitch setting affects the received tone only. The side tone (key down) is fixed at 800Hz regardless of the (received) CW pitch setting (menu 40). And unfortunately, there is no internal adjustment to change the side down frequency. Therefore the only zero beat method available after CW pitch is changed away from 800Hz is to use the 'rev' button as previously described. Once zero beated, the received tone will equal that which you have set in menu 40. Your side down will remain, now and forever, at 800Hz. See the note at the bottom of page 28 in the operating manual.

An alignment menu is just that. Think of a bunch of pots and coils to adjust, where is default? In a menu driven alignment the pots and coils are replaced by a computer. There are no defaults therefore you can't do a reset to go back. That's why I caution about going into an alignment menu if you don't have the right equipment and the understanding of how it works. --- In ts-850_450_690@yahoogroups.com, <yankee495@gmail.com> wrote: Can't the radio be reset if he messes it up? Hi all, I have been following the group for a while, I was given a TS-850 2 years ago from my friends grandad who is sadly now silent key. This rig had lots of problems which were all resolved and linked to the radio taken a bashing to the controls probably from a power supply. All was fixed with some new parts and the radio was operating correctly with quite a good number of QSOs to prove its correct operation. However yesterday I turned it on and noticed there as no receive, the ON AIR LED showed a dimly lit state and the radio seemed to think it was transmitting. This is the same when the mic is connected and disconnected. There is no power output from the radio until I actually hit the PTT and on occasion the dimly lit LED does go out and the radio will begin to receive again. I would guess that there is something wrong with the PTT circuit, maybe a dicky relay or capacitor not discharging but I thought it would be best to ask the experts who might be able to shed some light and shortcut me to the answer. thanks 73 Denis - M0USV

 Look at the 47uf SM cap on the Car Unit. It has leaked and shorted the TXB line under it. Remove it and clean up the mess including cleaning out the burned PCB. You can us a regular 47uf cap in it's place. Do you have an IF-232 C interface hook up to the TS-850S? I think you need that, also if you have a USB to serial cable make sure it has the FTDI chip. If you have the prolific driver cable you will have problems.

good luck

The IF 232 changes the signal levels from rs232 to level required by the 850. There are a number of ways to do that as the IF232 can be hard to find. The IF232 schematic is on the web as are a few equal designs. Not complicated at all if you have to build.

Also I have seen several integrated cable assemblies that supposedly replace the IF 232 but I have no history on their use.

A little advice needed from the group...have a Timewave DSP-59+...but have not connected it as yet to the TS-450...
The 59+ has a PTTi jack...at the risk of sounding about as dumb as I actually am, do I need to make that connection, or simply hook up the audio jacks (I do not want cause any damage to the radio!).
And if the PPTi connection is recommended, what's the best way to do it?
(I have a KAM Plus in the closet, and it came with a cable that had the ACC2 connector and the 8 pin to the KAM, and on the 8 pin side was also a 3.5mm jack---I wonder if that would appropriate to use on the 59+, if even needed.)
Thanks in advance.
Rick

Rick,

You can simply connect the DSP-59+ in the audio line as intended. If you have feedback or audio issues without muting the 59+, you can then mute the 59+ by applying ground, if I recall correctly, to the PTT connector on the 59+.
There are gnd-on-PTT connections on the 450S but I can't say which or where without the manual on hand....Good DX and 73...Jordan VE6ZT

I use a DSP59 with my 850. The fixed output from the 850 goes to the 59. The 59 line out goes to audio input on sound card, and the 59 output goes to the SP31 speaker channel A. The audio out of the 850 goes to the SP31 channel B.

I do not use the ptt connection on the 59. I run mostly digital and some cw.

Hi
Having a problem with Mic feedback when I connect my DSP9+ or MFJ784B tried rear speaker socket and front headphone socket. No apparent RFI issues when using Digital modes. Any suggestions, apart from leave the DSP out of line :-)

Thanks
Pete

I use the IF-232 from ZLP Electronics with my TS-850S and I can tell you that this CAT interface does everything the Kenwood IF-232 and it is only a fraction of the price. The service from ZLP Electronics is second to none. I recommend this CAT interface.

The IF 232 changes the signal levels from rs232 to level required by the 850. There are a number of ways to do that as the IF232 can be hard to find. The IF232 schematic is on the web as are a few equal designs. Not complicated at all if you have to build.

Also I have seen several integrated cable assemblies that supposedly replace the IF 232 but I have no history on their use.

I had the same problem, and it drove me crazy for a while. You must use a different power source for the outboard dsp, than the one for the radio and that took care of my problem. If you use the same power source for both you will have RF.

You must use a different power source than the one for the radio, to power the outboard dsp, or you will get rf from the dsp unit.This drove me crazy untill I accidentally ran across this information. It solved my problem. Jim AB9NA

Adam, the problem with the power dropping off while the ALC jumps up is probably due to a defective dc-dc converter board. A web search on “ts-850 dc-dc converter” will give information on it. I had to replace one in my 30 mil s/n TS-850 a few months back. Unfortunately, I don’t think they are still available from Kenwood.

The audio problems could be due to a bad capacitor. I would check them closely for signs of leakage. I’ve had to replace a good many in my 30 mil unit but none at all in my 50 mil TS-850.

Hello to all. My 850 suddenly went from 100 watts output to 10-15 watts output. While talking into microphone at a normal level, the ALC meter reading pegs red. I can adjust the mic level control and bring the ALC into proper range but, RF Power drops to around 3 to 5 watts. The ALC level meter reading never ramps up and then down as is common with a bad DC TO DC Module. The RF Power Level Control located behind the Mic Level Control Has no effect at all. It will not change the RF Output Level. I happened to have a new spare DC TO DC Module on hand so I installed it with no change in operation. Apparently something else is the culprit. I have not gone any further at this point. Anyone out there care to throw out a remedy. This problem happens on all bands, with or without the Antenna Tuner, transmitting on an antenna or in to a dummy load. Thanks in advance for your thoughts...Larry N4QDE - West Tennessee, USA

No the tune button is not activated....boy I wish it was something that simple. I have a shop manual for the rig. I believe I will take a look at the block diagram and see which circuit board has the ALC circuit on it and also see where the RF Power Level circuit is located. see If I can determine if there is commonality between the two for starters. Thanks for your question.

Sorry Bob I jumped to fast and answered only the first question. The Power Supply Voltage is 13.8 during receive and not much less during transmit due to the output power being low as well. If I ever figure this problem out myself, I will post the repair here. Thanks again Bob.

Just picked up a 450 and c104 had leaked just around its self. When I took the filter cover off i notice that most of c104 had dripped down onto the filter cover so most didn't get on the board or I just got lucky. I want to clean this up and just wondered what everyone is using. Also picked up a battery to change that out but haven't tore it down yet to see if has leaked.

Why is the c104 so leaky does it need to be a higher voltage? Why is this one the one that fails in all the 450's?

12386. TS850D +AT no Tx output power

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-10-05 12:09:28 UTC
From: Michel Spelier
Topic: 12386 Message: 12386

Hello,

I have developed a Tx-problem on a largely underused TS850D (serial number >3M) fit with integrated antenna tuner and both Inrad 400Hz CW filters.
(with or without the large Kenwood PS-50 PSU)
The Rx still works like a charm...

The meters show normal output power/modulation/VSWR indication but there is no signal audible on the monitoring RX.
At least not for a sustained period...
I have briefly heard the carrier (some ms) after key or PTT activation ...

On SSB, the ALC occasionally points to maximum so I replaced both the:
-DC/DC converter board (hb copy of OZ1BXM's) and
-the ten 10µF/10V SMD by 16V variants (the 47µF SMD was replaced earlier by a larger electrolytic one)
There were 3 obvious leaking SMD caps on the carrier board and these areas were cleaned with a fiber pencil.

Before deciding to let it go for spares, what else should I try, should I measure?

Thanks for sharing your experience,

73,

Michel, ON7EH

12387. TS-450 SSb filters

Yahoo group: TS-850_450_690 (2010 — 2016)

From: <n8ibz1@...>
Topic: 12387 Message: 12387

Have a question about the TS-450 8.83 filters.

Can I put in a 2.4 in #2 8.83

and then put the 1.8 in #3 8.83

The manual states that either cw/ssb filters can be installed in the two positions where 8.83mhz filters are installed.

I am using the 450 for SSB only and also want to put an Inrad SSB filter in the 455 slot.

Thanks in advance for any input.

Mark,

You can, and I have; it works fine.

As long as you know the 1.8 is in the SSB position, it doesn't matter that it says "CW."

The radio remembers the last combination of filters used per mode.

Mine is set up that way. Works great – as long as you retune the PBT to reflect the change in bandwidth when you switch in the 1.8 KHz filter. I have a .5 KHz in the 455 slot, so can't say if putting another sideband filter into that slot that improves it more.

12391. TS 450 Repair Advice

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-10-11 14:57:25 UTC
From: <wa8dof@...>
Topic: 12391 Message: 12391

Hi Guys

New member here, seeking advice.

An older friend just gave me his TS-450 S and ask me to repair it. He said he was trying to load a random antenna on 20 meters and "the smoke came out".

I found that the lightening suppressor (DSA 301 LA) is now a melted lump of glass and the smoke he detected was the circuit board charring. The traces appear to be intact, but I do not know what other damage he has done. he says the receiver still works well.

I have a couple of questions.

First, does anyone know of a replacement part for this DSA301LA ? I can not find the part listed at any of my usual sources.

Second, does this part do anything besides provide protection from static buildup? I would like to power up the transmitter into a dummy load to see if he smoked any other components, but am reluctant to do so without this part installed. (I removed the melted part).

Thank you for reading and any help you can offer.

Dave

12392. Inrad #95 for ts-450 - Which pins to cut?

Yahoo group: TS-850_450_690 (2010 — 2016)

I did a search and found a chat about which pins to cut to install the Inrad #95 but never did find the answer. Anyone have a pic of which 2 pins to cut off. If a pic is not available here I will add it once I find the answer. Inrad sends instructions but I picked this one up used, hence the reason why I am asking the question.

I had to replace one these on my TS-690S last year and it was available from Kenwood out in California and as what I remember was not that expensive. Give them a call and talk to one of their parts department people as they were very helpful. They also had great service when it came to mailing it to me.

Hope that help and good luck.

Subject: [TS-850_450_690] TS 450 Repair Advice

Hi Guys

New member here, seeking advice.

An older friend just gave me his TS-450 S and ask me to repair it. He said he was trying to load a random antenna on 20 meters and "the smoke came out".

I found that the lightening suppressor (DSA 301 LA) is now a melted lump of glass and the smoke he detected was the circuit board charring. The traces appear to be intact, but I do not know what other damage he has done. he says the receiver still works well.

I have a couple of questions.

First, does anyone know of a replacement part for this DSA301LA ? I can not find the part listed at any of my usual sources.

Second, does this part do anything besides provide protection from static buildup? I would like to power up the transmitter into a dummy load to see if he smoked any other components, but am reluctant to do so without this part installed. (I removed the melted part).

Thank you for reading and any help you can offer.

Dave

Thanks Ausbin

I never thought to try Kenwood. Boy am I dumb! My regular parts suppliers do not list it and I could not even find a data sheet to determine the specs.

I will give Kenwood a call tomorrow.

73, Dave

UPDATE:
It turned out to be about 10 leaky caps. I hadn't been able to notice the damage. But a trip off to AVVid and it is back and working fine for a very reasonable price. It now has a new home with a friend down the street.

Thanks, Cliff!

HI All

I know this is probably impossible, but I need a board for my TS-450 if anyone is parting one out.

I need the X46-3120-00 board with the CAT controller. Mine went south and now it won't recognize the computer any more. Thanks and 73

12398. TS-450 loses all receive audio, especially when cold

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-10-18 23:12:46 UTC
From: Zack
Topic: 12398 Message: 12398

I acquired a fixer-upper TS-450SAT a few weeks ago that I'm struggling to figure out.

When it is cold, the receive audio will randomly drop out completely, as if the squelch is kicking in. When it happens, the S-Meter drops to 0. The audio amp IS still working, as the buttons still produce beeps.

The problem never seems to happen at 1.8 and 3.8MHz, only 7MHz and up. When it goes out, it is dead on all of the bands/frequencies, 40m and up.

It affects all receive modes, and changing the receive filters (stock bare-bones, no add-ons) makes no difference.

I've tried all of the various options (NB, RIT, Notch, etc..) and none of them make any impact on the problem.

Looking at the two outputs from the PLL board on a scope, I'm not seeing any noticeable difference in frequency or amplitude when the receive is working vs. not.

The only other symptom that I've noticed is that when it IS receiving, the frequency seems to be drifting very slightly, like maybe +/-50 to 100Hz - I can hear it shifting, but it's not distorting or causing me to re-tune.

If anyone can point me in a direction, or give me some clues as to why this particular frequency range would be affected by a single problem, I'd be quite grateful.

Yes, I do have schematics and service manuals. It's a low serial number, 2xxxxx.

Zack Clobes, W0ZC

I re-read my notes and it does always work at 7MHz too. I realized that the AIP turns on automatically below 9.5MHz so after some tinkering, I think that's where my problem is.

The radio will work with AIP on, but not without it.

The AIP feature is new to me, so it's time for me to do some reading on that...

Zack

12400. DSP-100 wanted

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-10-19 22:25:59 UTC
From: w7fe
Topic: 12400 Message: 12400

My friend Rick, N5IZC, asked me the other day if I had seen a DSP-100 come up for sale recently on any of the usual online sources. I had not, and based on a bit of subsequent archive searching, it would appear that there aren't many of these changing hands out there.

If anyone on this group has a line on an available DSP-100, please contact N5IZC, Rick, using his email address as listed on www.qrz.com.

Thanks and 73 de Stu, W7FE
Henderson, NV

Going to be parting out a ts-450 all is to go but the pll board because I think it has a problem with it. It goes the the dots and it will read out 50mhz on it but won't stay it goes to the dots. I know this radio does not do 50mhz but this one does. Also the guy I got the radio from had someone change one of the 6631 chips to a 66312 chip. Radio worked when I got it and was got to try to fix it but it sat for about 4 or 5 mouths then I hooked it up and was going to start working on it and the dots came up on it... So now I'm going to sell it as a hole to someone AS IS or I'm going to part it out to people who need parts to fix there's. All parts are going to be sold AS IS. Would like to sell as 1lot to make it easer on me..lol.. Lets get the prices going on it.. If you won't pics please just email me to ve3mph at yahoo dot com you all now how to fix the email address.. Thanks

From: <robzs5la@...>
Topic: 12398 Message: 12405

Hi Zack

The AIP "on" means the RF signal from the antenna bypasses the RF pre-amp and feeds right into the 1st mixer. With AIP "off" it goes via the pre-amp. So...the problem may lie with the pre-amp not working anymore. AIP stands for "Advanced Intercept Point" and by by-passing the pre-amp, it improves the dynamic range of the receiver. Q9 and Q10 are the FETs for the pre-amp. Check if they are getting power or else they may be defective. Q9 and Q10 are wired in parallel and are on the RF unit PCB.
Hope this helps your trouble-shooting.

Thanks for the reply. I turned the radio on and push the Auto/thru and them the tune in and nothing happens.
Like if the tuner was not being activated. I did check the connections and inside and itt looks connected.
I am going to see if electrical power is reaching it.
Thanks
Sergio

Thanks for the info on the AIP. I've traced the control line back into the RF board and I find the three transistors (Q11-Q13) that bias the PIN diodes. The voltages in this circuit are all very consistent with the Service Manual.

I'm doing my testing at 14.155MHz, so the Q9/Q10 amp should be the only active components in the path.

Right now, all of the PIN biasing looks correct, and I have about 11V into the amp, with the other two legs of the FET's at 0V and ~3V, which should be about right according the SM. I'm not finding any DC paths to ground that shouldn't be there.

I tried bypassing the RF path by putting a cap across D28 to D30 which made no difference. I also injected some 14.155MHz RF directly into input transformer at the first mixer (L51), which still made no difference.

It would seem that the problem HAS to be right in this area - I'm sure I'm staring right at it. Is there ANYWHERE else that the AIP control circuit goes?

--- In TS-850_450_690@yahoogroups.com, <robzs5la@...> wrote:
>
>
> Hi Zack
>
> The AIP "on" means the RF signal from the antenna bypasses the RF pre-amp and feeds right into the 1st mixer. With AIP "off" it goes via the pre-amp. So...the problem may lie with the pre-amp not working anymore. AIP stands for "Advanced Intercept Point" and by by-passing the pre-amp, it improves the dynamic range of the receiver. Q9 and Q10 are the FETs for the pre-amp. Check if they are getting power or else they may be defective. Q9 and Q10 are wired in parallel and are on the RF unit PCB.

Topic: 12398 Message: 12409

Finally figured this out this afternoon. It turns out that the problem was rooted in the C104 problem on the IF board. I had just glanced at the board and thought someone else had already replaced that cap, but it turns out that they hadn't.

Buried back behind the 455kHz filters I found a glob of electrolyte from the capacitor that was bridging the AIP control line with the Receive Muting control line. Basically that electrolyte had eaten through the solder mask and was putting a high (active) on the Rx Mute, randomly when the AIP was turned on (high).

Pulled out the bad cap, cleaned up the board, put it back together and the rig is working great!

Zack

12410. TS-450SAT - No TX in any mode, Ant. Tuner inop - error CHEK

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-10-28 20:38:07 UTC
From: <dangit5@...>
Topic: 12410 Message: 12410

I ran into a past message with lots of replies and lots of useful info - back from late 2009 - early 2010 about this problem.

The problem is , that thread did not conclude with -fix-. a lot of check this, check that but no message with the AH HA! moment.

My 450SAT has no TX, nothing switching, the symptoms of PTT on power up. I have yet to all the check voltages mentioned in the 2010 thread. But I did check the voltage on pin 2 of the mic connector. I didn't get the 8V, I have 1.78V pn pin 2. In receive mode, I have 7.96V on the RXD line, 0V on the TXD line. Grounding pin 2 (Keying the PTT), no PTT action what so ever, TXB remains at 0V.

I have ordered enough transistors, resistors, capacitors, etc, even IC11 and IC12 from Digikey to replace almost every part in the keying circuits if I have to. The diodes in that circuit - MA110 was not a normal stock item and the minimum order is 3000-5000 diodes at Digikey and the RLS173 is obsolete however... any sugestions for replacements for those diodes? (I have not looked into cross-reference yet)

I really don't want to go through all that SMT rework if I don't have to. So if anyone has figured out the common problem why the PTT is being dragged down on start up, please post your finding / solution.

Thanks

Topic: 12410 Message: 12411

I took some voltage readings.

I have to say though, This is without C67 in place. I removed that capacitor to check its capacitance on the meter, But when removing, the solder cap on one end of the chip capacitor came off... oops. Also Q65 has been removed. That was removed because I read somewhere else that Q65 was a common cause (short) for this issue. Q65 is the packet transmit transistor. Again, a terminal sheared off so it could not be soldered back on. Kenwood uses adhesive under these SMT components so simply just lifting one end is next to impossible.

I'm not going to be lifting any more components until my Digikey order arrives (in the next couple days) But in the mean time, if anyone needs me to take a voltage somewhere, I can do that.

Onto the voltages... all voltages taken in RX mode since there is no PTT control at all

Q50 ---
Base === 7.89V
Emitter == 0V
Collector = 0V

Q52 ---
Base === 1.89V
Emitter == 1.89V
Collector = 1.89V

Q53 ---
Base === 0V
Emitter == 0V
Collector = 1.88V

Pin 2 of mic connector = 1.87V

RXB == 7.86V
TXB == 0V
CWB = 0V
SS === 1.87V
CSS == 0V
TXI === 0V

If anyone needs more info or voltages, just let me know.

Hi all,

After gazing at this group for many years now (I have been the happy owner of my TS850 for 6yaers now), It's me to submit a problem:

Yesterday when I switched on my Xver, everything was OK.
A few minites later, the display exhibited stange things (no more figures, a few dots in some places), the major part of the front panel buttons were deaf and also the knob, the audio sounded very distorted.
Panic!!!

After reading many comments and posts, I decided to change the whole chemical capacitors (with brend new ones) on the Display board, Digital unit and CAR unit.
Note that none of the capacitors nor the battery were leaky.
Result? always the same problem.

-As the display unit often reported problem looks to be the capacitors, it should be fixed.
-As the audio distortion could be a misalignement in the local oscillators
-and As many buttons do no respond
I found the crossing point of these symptoms could be the Digital Unit.

Am I right or wrong?
If I am right, what problem can occur on this board?
Does any boby have any experience to share?

Tnx for helping my 850 survive.
Fortunatly, I am still on air with my old Atlas 210X!!!

Fred, when I got my 450s the display only showed 8.83 and 455 up in the upper left hand corner. Nothing else worked, no buttons, did have audio hiss and that was it.

It was the digital board. Bought another off Ebay and replaced it and it has worked ever since.

I had problems on the display of the TS850, practically disappeared while working around the display with directions, because capacitor 18 c on the display board was old release with liquid on the pcb.
The second type of failure that seems to manifest more of the logical drive, I also had this kind of problem, tune the frequency crashed and could not be more 'change while all the radio buttons were stuck, solution changes the entire card digital unit, which I have kept for spare parts.

12418. TS-450S (AT) internal tuner quit working

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-11-02 03:41:05 UTC
From: <k4shp@...>
Topic: 12418 Message: 12418

Hello everyone. The tuner in my 450s-at has quit working. It acts like it isn't even installed. I have checked menu items 31 & 32 and they are both on. Pushing the Auto / Through button has no effect on the received signal and when you push the #4 to activate the tuner nothing happens.

I have checked the connections inside the rig and all looks as it should. This one has me at a loss. It was working fine and just quit one day!

Help,

73

Hi Dave and Expeditus,
Thank you for your replies.
Sorry for my late reply, I was out from home.
As mentionned, I already change all the chemical capacitors on the Display Unit (among them, the C18 tricky one) and also on the Digital Unit. Unfortunatly, it did not cure the problem.
So, as suggested, I ordered a Digital Unit un eBay. Hope it is good...
I should receive it in the coming week.
Once I have swapt it, I'll tell you the result.

Once again, thank to you and we keep in touch.

12421. TS-450S and MC-60 desk mic

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-11-03 10:12:08 UTC
From: <steve_wilson@...>
Topic: 12421 Message: 12421

My used TS-450 came with both the hand mic and the MC-60 desk mic. I decided to check out the desk mic. I hadn't realized it was amplified. The batteries are good, yet if I kick in the mic amp on the base, nothing seems to transmit. Am I missing something or do I just need to get this mic fixed?

Thanks, Steve

Hello,
Dont you have a local Ham-shop that can sell you one of these 13-pin DIN????
Try this:
http://www.ebay.com/sch/Consumer-Electronics-/293/i.html?_from=R40&_nkw=13-pin+DIN

Or just type "13-pin DIN" in the eBay search field.

Hi all,

I have a TS-450S that I bought second hand back in 2001. It sat around while life got in the way of going for my general, which I finally got in 2010. I've been having a ball these last few months talking to all kinds of new countries with the rig and my Cushcraft R8. But the other night, on 40 meters, someone told me that I was really distorted.

I just got done doing some troubleshooting with a buddy of mine. We started on 40 meters and he agreed that there was an issue. We then went to 15 meters and all sounded fine. I then went through jiggling various portions of the mic cable to see if that was the problem, but the symptoms didn't reoccur. We then went back to 40 meters and my friend said I sounded great!

Since 40 meters was bad when we started, but was fine when we came back, the only thing I can think of is that it has something to do with the switching between bands and is a dirty contact. I'm not electronics guy, but I have many friends who are. Is there a component that handles the band switching that can be cleaned somehow? The only other idea I have is to send it to Kenwood and have the whole rig gone over.

As I work more and more DX, there certainly is the underlying desire to get something newer. But I love this rig and always get good reports on the audio.

Thanks, Steve

Steve, In any electronics troubleshooting the first thing is you have to be sure the voltages are correct so make sure your power supply is functioning properly while transmitting.
You said you were jiggling the mic cable then all was well. Do you have another mic to try, or can you borrow one?

I did not say that things changed with the mic jiggling. Nothing changed. What seemed to cause the change was changing bands and changing back to the 40m band.

Not sure what exactly you are referring to as to the power supply functioning properly during transmit.

Thanks, Steve

If you have a second receiver at your home, you could listen to yourself directly to eliminate any possibility of propagation or EMI causing the problem. Again, with a local receiver, you could also transmit directly into a dummy load to further eliminate variables.

The next thing I would do (either local or with another ham in town) would be to go through all of the bands 10 through 80-160 and see if the problem happens anywhere else.

There could be lots of things that would cause this. Some of them would be internal to the radio, but there are other external factors that could come in to play, like a poorly filtered power supply, a fan blowing onto the mic, EMI getting into the radio or mic cord, etc. The best way to track it down is to document exactly when it happens, and find a way to consistently reproduce it.

Oh, and if you can get someone to record some audio, that may help too.

Steve, one of the things about the power supply not functioning properly is what Zack said below about filtering and also is the voltage keeping up with the load on transmit.
Sorry I misunderstood about the mic cable.

Subject: Re: [TS-850_450_690] Intermittant issues on 40 meters

If you have a second receiver at your home, you could listen to yourself directly to eliminate any possibility of propagation or EMI causing the problem. Again, with a local receiver, you could also transmit directly into a dummy load to further eliminate variables.

The next thing I would do (either local or with another ham in town) would be to go through all of the bands 10 through 80-160 and see if the problem happens anywhere else.

There could be lots of things that would cause this. Some of them would be internal to the radio, but there are other external factors that could come in to play, like a poorly filtered power supply, a fan blowing onto the mic, EMI getting into the radio or mic cord, etc. The best way to track it down is to document exactly when it happens, and find a way to consistently reproduce it.

Oh, and if you can get someone to record some audio, that may help too.

Are you still happy with this set up? I'm thinking of doing the same, although it looks like the rubidium references have gone up quite a bit in price since then.

I bought a txco from a ham that custom makes them on ebay they just solder on the board! No issues! Give me a few days to find the info and I will pass it along!

Put one in my 850 and 870.

I would think that finding the cause of off freq. , then address that ?
Before adding things to rig .
I do not remember if there were some issues , like so many other circuits
in these radios and leaky caps affecting freq. ?

Bryan, This is what I've done a few times and it works very well.

Tune into WWV at 20 MHz. If you can only RX 15 MHz that'll work just not as well as 20. Tune so your display reads 19.999.70 on one VFO, USB. Tune the other VFO to 20.000.30, LSB. Switch back and forth between VFO A and B. The oscillator tones should sound the same. If not, you can adjust the local oscillator so they do. Listen very carefully. It takes a very fine adjustment to change. Using WWV at 20 MHz will be more accurate for 28 MHz than using WWV at 15 MHz.Of course do this after the radio has been on for maybe a half hour or so to make sure all temperatures have stabilized. My 850 does not change from cool to warm. As far as I know I do not have the TCXO.

This method works great and since we can be confident that WWV is "on frequency" it will work. Afterwards all other lower bands will be correct.

One thing you will notice is that when tuning lets say at 20.000.30, and the VFO is on "fine", you'll be able tovery slowly turn the VFO and get the tones/frequency to change (just slightly) before the freq readout will change to the next digit.
Also, make sure the "slope" tunes are correct so you are using the same passband on both sidebands.

When you think you've got it, take note of signals on 10 meters over several days before you make any judgments because others may not be exactly on frequency.

You may find that you actually do not need a TCXO after all. You'll get it. Let us know.

I don't have it setup yet Zack but, the stability will be at least one order of magnitude better
than an OCXO, which is better than a TCXO. Some time ago, I decided to not settle
for less than the best if I could afford better performance.

John, I passed on Bob N3BA's VCTCXO. If you want less expensive than that with
better stability, you use the Kuhne Electronic crystal heater. Even simpler and the
least expensive is use of a PTC thermistor that you attach to the 20 MHz reference xtal.
Damon/KC5CQW came up with that. Details are in message #9150.
Total cost: about USD $2.

OTOH, the rubidium source is not too costly, and returns dead-on accuracy and virtually
zero drift.

I like the concept of using the Rubidium because I can feed that into the 850, as well as the HP signal generator/counter.

Zack

I could pony-up close to $200 for the Kenwood SO-2 TCXO but IMO, they're WAY too "proud" of it, and it's still just a TCXO. I tried to find an off-the-shelf TCXO but 20 MHz is an uncommon frequency. There are other methods (N3BA TCXO, the Kuhne crystal heater, and KC5KCW's novel crystal heater using a PTC thermistor) but I wanted BETTER stability.
> >
> > Whilst perusing eBay, I found a UK chap selling an interface board that fits where the SO-2 fits, and lets you feed it 10 MHz. Additionally, if it doesn't see 10 MHz coming in, it defaults to the OEM 20 MHz rock. WAY cool! Look for item #120846302925. Cost: about $70 w/ shipping.

I do not remember if there were some issues, like so many other circuits
in these radios and leaky caps affecting freq.?

John
KD0CAC

REPLY: No. The thing that most often causes a crystal to drift is temperature (ambient and crystal heating). In this case, it doesn't look like the 850 pushes a lot of current thru the rock.
Since I do not have A/C to maintain a steady ambient temperature, it's going to drift some.

Bryan, This is what I've done a few times and it works very well.

Tune into WWV at 20 MHz. If you can only RX 15 MHz that'll work just not as well as 20. Tune so your display reads 19.999.70 on one VFO, USB. Tune the other VFO to 20.000.30, LSB. Switch back and forth between VFO A and B. The oscillator tones should sound the same. If not, you can adjust the local oscillator so they do. Listen very carefully. It takes a very fine adjustment to change. Using WWV at 20 MHz will be more accurate for 28 MHz than using WWV at 15 MHz.Of course do this after the radio has been on for maybe a half hour or so to make sure all temperatures have stabilized. My 850 does not change from cool to warm. As far as I know I do not have the TCXO.

This method works great and since we can be confident that WWV is "on frequency" it will work. Afterwards all other lower bands will be correct.

One thing you will notice is that when tuning lets say at 20.000.30, and the VFO is on "fine", you'll be able tovery slowly turn the VFO and get the tones/frequency to change (just slightly) before the freq readout will change to the next digit.
Also, make sure the "slope" tunes are correct so you are using the same passband on both sidebands.

When you think you've got it, take note of signals on 10 meters over several days before you make any judgments because others may not be exactly on frequency.

You may find that you actually do not need a TCXO after all. You'll get it. Let us know.

Bob WE6C

REPLY: I prefer to use the Rubidium source and interface PCBAs I already possess,
and ALWAYS be certain my two TS850s frequency displays are dead-on.

Topic: 12415 Message: 12441

Hi Espedito, Dave and all,

I received this morning the Digital Unit for my TS850, placed it ans all is good now.
So the failure occured on this card.
My transceiver is repaired and I am back on air. Nice!!!

Just a last thing:
The failed card has a RAM with version "JEZB 1990".
The one I received has a RAM with version "JBL1".

I swapt the RAM ICs and everything is still OK.
So this is not a RAM failure (the only IC that can be easily changed).

I know there is no note from Kenwood about the difference between the 2 versions.
Does any body know something?

However, I have a failed card with "JEZB 1990 ". If someone is interested...

Thank for reading and CU on air

Subject: [TS-850_450_690] RE: TS850AT Digital Unit Failure?

Hi Dave and Expeditus,
Thank you for your replies.
Sorry for my late reply, I was out from home.
As mentionned, I already change all the chemical capacitors on the Display Unit (among them, the C18 tricky one) and also on the Digital Unit. Unfortunatly, it did not cure the problem.
So, as suggested, I ordered a Digital Unit un eBay. Hope it is good...
I should receive it in the coming week.
Once I have swapt it, I'll tell you the result.

Once again, thank to you and we keep in touch.

Subject: [TS-850_450_690] TS850AT Digital Unit Failure?

Hi all,

After gazing at this group for many years now (I have been the happy owner of my TS850 for 6yaers now), It's me to submit a problem:

Yesterday when I switched on my Xver, everything was OK.
A few minites later, the display exhibited stange things (no more figures, a few dots in some places), the major part of the front panel buttons were deaf and also the knob, the audio sounded very distorted.
Panic!!!

After reading many comments and posts, I decided to change the whole chemical capacitors (with brend new ones) on the Display board, Digital unit and CAR unit.
Note that none of the capacitors nor the battery were leaky.
Result? always the same problem.

-As the display unit often reported problem looks to be the capacitors, it should be fixed.
-As the audio distortion could be a misalignement in the local oscillators
-and As many buttons do no respond
I found the crossing point of these symptoms could be the Digital Unit.

Am I right or wrong?
If I am right, what problem can occur on this board?
Does any boby have any experience to share?

Tnx for helping my 850 survive.
Fortunatly, I am still on air with my old Atlas 210X!!!

Hi Dave and all, soo happy for you radio TS -850 , keep it under observation, if you can send the photo to the ram that you say I have checked my previous card , says " jbl 6b4b ," I try to make a hypothesis : no ta is that unlike in the European version than us , which meant it was mounted on u ts 850 (america) ? possible verification of coverage of the bands if they change the coverage in the transmission of frequencies , which is not always removed the diode d 11 , in this last case the diode d11 gives conseso the transmission in continuous tuning 0-30 mhz. However, I'll offer my best wishes and congratulations for the repair I hope to hear from you soon in 40 meters dov often listen to . Last thing I wanted to warn you to look at the web to find many mods.dk best modifications on your radio TS -850 , I run on my ba1 in lithium battery that easily taking the example of what had been published . Best wishes and happiness and many QSO

ive had a 430s for some time, nice rig. I decided to buy a 450s and keep the 430 for backup, well bought the 450 working pretty good, the display was a little brighter than it should be but worked looking at it sideways, a week later when I turned on, all display was completely on and radio did not respond to nothing,i tapped the top of the radio and started working again, like cold solder. as usual worked for a week this morning I turned it on ok I was monitoring and all of a sudden display turned crazy again all lights on like low current and did not respond to nothing. I have tapped all over the radio and nothing. I also opened radio and tapped boards and nothing. any idea where I should look... tryied another ps and the same.

Well, at least for one of your problems (the ALC problem), you need to check the -6V power supply (DC-DC unit). It is a tiny PCB located on an small PCB, just between front panel and CAR UNIT box, on the top side of the chassis, hidden among lots of cables. You can get it out carefully from the side, once you have removed the cables which go to it.

To fix it for sure, you need to replace a couple 2SC2712 transistors, a 2SA1162 and four 33uF/16V caps. Most times just the 2SC2712s and the caps will do.

Of course, before doing that work, you can check the -6V line to see if it is changing. I guess it will.

BTW, the DC-DC schematic is on the RF UNIT one (page 126 of the manual)

Regards,

JOSE

12452. ts-850s no RF output

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-11-25 19:01:17 UTC
From: <k2gmy@...>
Topic: 12452 Message: 12452

Uh Oh. No smoke, but bad smell.....then no RF power output !
Is there a description somewhere on how to test and take apart the final output stage of the TS-850S ?
And maybe a video or description for removing and replacing Power Transistors? This is a new experience for me, and would like to give it a go, rather than sending the rig away for repair !
Thanks in advance for any forthcoming guidance.
73, Dick K2GMY

12453. TS-850 No VOX?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-11-25 22:30:36 UTC
From: <iandetom@...>
Topic: 12453 Message: 12453

Hi all, I have a TS-850 I have been working on, no tuner and no extra filters and no DSP. On the carrier board, I have replace 9 of the surface mount capacitors so far. I have gotten all the leaky ones replaced and the 4 that are left are the ones in the middle of the carrier board. (hardest to get to!) I have been changing them in groups of three or four and then trying out the radio. This way, if I create a new problem, I know where to look. My carrier board has the 6631 9028 1aub chips on it. The radio is actually working pretty good but I have a couple things not working, one is one of the attenuator positions is not working, radio goes silent when I switch in maximum attenuation and the other glitch is the VOX is not working. VOX does not work in CW mode nor SSB mode. The cw mode is the one I want to work. I have not pulled the face of the radio down yet, that is coming soon as I want to replace the battery. Oh yeah, on my carrier board, I have been replacing the old caps with new 35 volt electrolytics that are not surface mount, axial leads I think. They install good and are easier for me to work with. Can anyone point me at some things to look at for the VOX issue? Thank you all for reading my post and thank you in advance for any info you might send me.

12454. Receive issue with 850

Yahoo group: TS-850_450_690 (2010 — 2016)

Have a receive issue with a TS-850. It receives ok in FM and AM but in SSB it is garbled and almost sounds like it does not tune while turning the freq knob. Thought it may be the D31 issue but that has not fixed it. Anywhere else to start looking ?

Thanks

Tom N8NMA

Yes... check the CAR UNIT for capacitor leakage, similar to what is
shown here:

http://jvgavila.com/wb7.htm#sec3

If it has leakage, carefully remove, _clean_, repair traces / vias and
replace caps.

Regards,

JOSE

Tom, you have the same exact issue that I had with my 850, and this is from a bad DDS chip. I ended up selling mine as a part radio because it is very hard to find a replacement chip or board. There are 4 6631 or 66312 DDS chips on the CAR board and one of them is used for SSB product detector. When this chip quits, you get all garbled SSB audio while FM and AM are OK.

I am sorry to hear that you have this issue, but the only solution is to find a replacement board or chip if you have ability and tools to replace the chip. There is an info about which one causes this issue, so you just need one chip. I have checked all parts suppliers and none of them has it. Some vendors in China claims that they have them but I didn't go for it. I hope you find a solution as I miss my 850 a lot. Good luck!

I think I'm starting to have the same issues with my 850 - the SSB sounds garbled at times. I haven't tested AM or FM yet, but I do have a set of caps on order, hoping that will get me going. I've inspected the CAR board and don't see any visible damage, but I haven't removed the old ones yet either.

As for the chips, I thought that the newer 66312 chips (which I have) were far less susceptible to this problem than the older 6631's were. Are the '2's a problem also?

Well the caps on the CAR board are the original caps and show some signs of leakage. The audio also is nearly gone on receive on SSB and there is no transmit ???

No transmit is also the symptom that I had with the DDS chip issue. I bought a set of replacement caps and replace them as suggested, but that didn't do any. I sent an e-mail to AVVID and was told that this is most likely the DDS chip issue.

I see CAR boards becomes available on eBay at times, so you might get lucky to spot one. You can use either 66312 or 6631 chips on the same board. You will need SMT rework tools if you want to salvage chips. Fully working CAR boards are still very expensive in the used market but you can find one with chip issue fairly cheap. Do you know anyone who has SMT rework tools?

12462. Best replacement for 2SC2509?

Yahoo group: TS-850_450_690 (2010 — 2016)

What's the best replacement (besides the now expensive originals) for the 2SC2509's in a TS-690S? The 2SC3133 or the 2SC1945?

Thanks!

I think I'm starting to have the same issues with my 850 - the SSB sounds garbled at times. I haven't tested AM or FM yet, but I do have a set of caps on order, hoping that will get me going. I've inspected the CAR board and don't see any visible damage, but I haven't removed the old ones yet either.

As for the chips, I thought that the newer 66312 chips (which I have) were far less susceptible to this problem than the older 6631's were. Are the '2's a problem also?

Hi all, I have a TS-850 I have been working on, no tuner and no extra filters and no DSP. On the carrier board, I have replace 9 of the surface mount capacitors so far. I have gotten all the leaky ones replaced and the 4 that are left are the ones in the middle of the carrier board. (hardest to get to!) I have been changing them in groups of three or four and then trying out the radio. This way, if I create a new problem, I know where to look. My carrier board has the 6631 9028 1aub chips on it. The radio is actually working pretty good but I have a couple things not working, one is one of the attenuator positions is not working, radio goes silent when I switch in maximum attenuation and the other glitch is the VOX is not working. VOX does not work in CW mode nor SSB mode. The cw mode is the one I want to work. I have not pulled the face of the radio down yet, that is coming soon as I want to replace the battery. Oh yeah, on my carrier board, I have been replacing the old caps with new 35 volt electrolytics that are not surface mount, axial leads I think. They install good and are easier for me to work with. Can anyone point me at some things to look at for the VOX issue? Thank you all for reading my post and thank you in advance for any info you might send me.

The attenuator problem will be 4 resistors on the bottom of the RF board below K1 and K2 SMD's
You will find them on the schematic at the RAT line. R1 is 51 ohms R2 is 100 ohms R3 is 150 ohms and R4 is 82 ohms. I have seen them parallel them as well giving you 8 resistors to change. I don't have any info on the VOX but would look at D1 D2 and Q1 on the VOX board (X59-1080-00). Hope that helps.

For the vox you have to check behind the radio, where you can find 3 potentiometers that adjust the delay, the sensitivity and the anti vox circuit, turning them clockwise to increase it seems to me that all three parameters. if you go in iambic cw key automatic, your transmitter will output rf vox only with the key inserted. If may be useful to have all these adjustment procedures of your system kenwood 850.

12472. Troubleshooting DDS chips in TS-850

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-11-29 20:47:59 UTC
From: Zack
Topic: 12472 Message: 12472

I'm fighting with an '850 that is experiencing symptoms of DDS failure. I spent a few minutes probing around on the CAR board with a 'scope this morning and everything looked good during the problem.

Can someone else who has fought DDS failures tell me what I would expect to find coming out on the four coax cables with a bad chip?

I'm starting to think the problem is beyond the CAR board - maybe down in the PLL's but I don't want to just write off a common, known issue.

Problems on the PLL board are not uncommon. The trimming cap for the 20mhz pll is (at least in my later model 850) junk.

Problems in this board are however evidenced by a loss of lock - a series of dits from the speaker and (if I remember correctly) a row of dots along the display

Gary,

I had the same problem with the mic pot. Unable to find a Kenwood replacement, I used a 10k Bourns PTD901-2015K-B103. It fits perfectly on the switcher board but the 6 mm wide shaft is a bit wide for the metal panel that the shaft would go through. The metal front plate required a little work with a drill bit. It does fit through the plastic front panel of the Kenwood without any mods. It is a bit short and your original knob will not fit on it, but it is accessible with your fingers.. .

Mouser carries them and they run $1.57 each. I hope this at least gives you an alternative if you can't get an original part.

Just wondering if there is a list somewhere of the symptons of the DDS failure. The 850 I am working on has the 68312 chips on the CAR board. I have replaced all the caps. Still no receive on CW or SSB but fine on AM and FM. D31 is good and all voltages on that chip are fine. No transmit on any mode but a signal can be heard on a nearby receiver. Anyone ????

Thanks

Tom N8NMA

Do you have an oscilloscope? I found a point on the bottom of the PCB that was pretty telling for mine.

I'm not sure what all of the failure modes are though - I suspect there could be multiple symptoms on any given chip.

Well I decided to check it the old fashioned way. Took the CAR board out of my 850 and put it in my friends and sure enough that fixed his radio. Guess he will need to find a used CAR board somewhere. I have heard a rumor that the DDS chips may be manufactured again in China but don't know where I heard that or if there is any truth to that.

12481. TS-450S with a transmitting issue

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-12-04 23:41:53 UTC
From: <dangit5@...>
Topic: 12481 Message: 12481

I picked up a TS-450SAT that some screwdriver wizard was trying to fix. I got it with missing SMT components, through hold components colder in place of SMT, flux everywhere ... etc.

After replacing what was missing, taking a wild guess that it was one of 3 transistors - Q50, Q52 and Q53, the autotuner came back to life, but yet I still was in transmit inhibit. I found that the SS line was low. I traced the SS line and found it was grounded somewhere. I narrowed it down to the IF unit board. I checked capacitors to see if one was shorted and found that either the jack itself or the capacitor going to ground in-between the jack and L16 was the cause. I lifted one leg of L16 and whalla, I can transmit again. I've yet fix that short.

however, a new problem has arisen since I got it to transmit.

When I key the radio, it does not go back to receive, it stay stuck in transmit. When its stuck in transmit, SS line goes back to 8V, RXD is at 0V, TXD is 8V, CSS is 0V

in receive, RXD is 8V, TXD is 0V, SS is 8V and CSS is 5V

It transmit (PTT depressed) , RXD 0V, TXD 8V, SS 0V and CSS 0V

I have also found that the radio, while in receive, the radio will go to transmit without touching a thing! It keys itself.

Now I'm getting tired of this possessed radio. I've been pounding my head on the desk for 3 nights. Can someone give me a pointer or two where to look for this issue. I look at the schematics and I'm instantly discouraged because I fix one thing and another issue pops up.

If you need more info, feel free to ask and I'll answer.

Its too nice of a radio to permanently put in TX inhibit to use as a receiver only.

Thanks

Dave / N9NLU

On the RF board there is a transistor (Q5 I think) that is tied to the TX line that seems to be a common failure point. Your symptom doesn't sound quite right, but it would be worth a look.

12485. TS-450 RX Audio

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-12-05 17:53:51 UTC
From: <wa5tku@...>
Topic: 12485 Message: 12485

My TS-450 has developed a problem of no RX audio. The problem started showing up as no audio but if the radio was left on for sometime the audio would come on. Now the rx audio never come on. Also, the S meter would peg out max until the rx audio came back. This appears to me to be an AGC problem. I am wondering if anyone else has had similar experience and what did the find to resolve the problem. Hoping so save a lot of time search for the solution. Also the schematic in the service manual is so small it is hard to trace the AGC line.

Thanks for yo assistance.

73,
Wes

Wes I think your problem with the TS450s is a common problem. Maybe C103 off the top of my head. Take it up with Cliff at AVVID, he had commented on this on here in the past. Mine is doing the same thing. Just a matter of time until it shoots craps and had to go to Cliff. Nice radios, but they, like me, are getting old.

I would say it's c103 make sure it has not leaked on the board if so it has to be cleaned very well and replaced with a new pastor but also make sure it has not gone through the holes to the other side you have to pull the whole board and clean the whole board in that area

I seem to have been bitten by the PLL unlock bug. I am trying to determine the correct voltage @ TP3 on the PLL board. When it is in the unlocked mode I measure .7 vdc. When it kicks back in I read 3.75vdc. I read somewhere that it should be @ 5vdc. I seems to be working ok @ 3.75vdc.
tnx in advance.

12492. Fading audio

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-12-07 22:51:30 UTC
From: <TheBeekeeper@...>
Topic: 12492 Message: 12492

I just got a 450s from a long time friends estate. The rig worked well the first day I hooked it up to a power supply. After a couple days of being on, though, I noticed the audio steadily fading away until I could no longer hear it.

I also noticed that the S-meter stopped functioning. That is to say no signal strength is indicated on the S-meter (upper portion of the meter). Interestingly, the SWR meter (bottom meter of the two), does deflect with received audio. Is it supposed to do that??

I poked around the group files and found fading audio is a common problem with this rig. I read many references to C104 failure as being the reason for audio loss.

I'm wondering if the strange S-meter behavior is related to the same problem?

I don't have the manual for this rig. Will someone tell me the value of the cap that needs replaced?

Any other suggestions are greatly appreciated.

Sam

I kicked the spook out of the radio... it was Q52 that I replaced. I must have used a wee too much heat. However, I still have the transmit locking ON after the PTT (SS line) is switched off.

I've also noticed this ... when I switch to CW mode from ssb, it switches to transmit without touching the SS/PTT or CW key.

I'm kind of thinking that IC11 might be funky --- any opinions?

From: <myyahoo@...>
Topic: 12492 Message: 12495

The capacitor that causes this is in series with the audtio power amplifier where it couples to the speaker (a friend is sending me his rig for repair, so I haven't seen it 'live' yet myself). Looking at the schematic (the manuals are in the files section of this group), the voltage of the capacitor is underrated. I will be replacing it with a 25 volt cap, to help prevent this from happening again.

This isn't the first time I've had this issue with Kenwood rigs, the TM742 has a couple of underrated caps too. I like my Kenwood rigs, but these penny-wise/pound-foolish design decisions are not my favourite Kenwood feature! :(

I'm guessing that means literally that EVERYTHING lights up. Not just
the parts of the display that show the numbers you want, but every
display segment that exists lights up all at once.

Hi James

A friend of mine has an 850 with the same problem. All segments of the LCD frequency readout are lit, as are all the indicator lights. The problem appeared several days ago, but at first it only happened after he keyed the transmitter. Now, when he turns on the rig, all the indicator lights come on. He says that the LCD segments on the frequency display flicker when he rotates the frequency control knob, but they all remain on. All other functions of the rig appear to work normally.

I will be following this thread in hope that someone has had a similar problem and has a solution, although I suspect that the Readout board will have to be replaced.

Good luck.

Dave

Well, crap. I dropped the 1945's in, buttoned it all back up, turned it on and let it warm up, cranked the power to zero, then hit tune into a dummy load… and immediate and loud POP! The magic smoke came out this time. Opened it up, and both of the 1945's are shot, with one of them being actually cracked in half. I checked things over last time and didn't find any other bad parts on the PA (or so it seemed). I'm guessing that something else deteriorated in the 2 years that I had it apart sitting in a box. Why? Because I'm a procrastinator. I'm pulling it apart now, but I'm not sure when I'll have a chance to check/desolder parts to troubleshoot further.

Any thoughts/suggestions?

I opened up the 850 to change the battery. Found a good battery, and leaking caps on the CAR board.

Are tantalum (polarized; tear-drop) caps of higher voltage rating an ok substitute for the SM electrolytics on the CAR board?

I've done that, and checked circuit traces. And replaced the 3 cans on the display board and C182/187 at the edge of the IF board on the bottom of the rig since they seem to be problematic also.

At power-up, in CW, VOX off, I immediately had tone without having keyed anything; keyer jack empty. With VOX on, it tries to transmit but low power and tuner can't find a match.

When powered up, switching to LSB or USB cuts off the tone. BUT transmits and receives in sideband without letting out any smoke. Tuner hunts but doesn't find a happy place (used to work fine; antenna is an easy match).

I suspect I have a shorted transistor behind the CW switch that doesn't let the radio go to RX... but that doesn't explain the sidetone without anything keyed. And I don't yet have a clue about the tuner.

Any help would be appreciated! I have greater expectations of the group knowledge than my schematic reading and troubleshooting ability... thanks, KK4XX

If I remember correctly, there is quite a bit of difference between Tantalum and Electrolytic caps. If you have a 200µF cap you would need to replace it with a 20µF Tant. I would recap with the proper Electrolytic caps of the proper rating and voltage rating. Tantalum caps will fail ugly and the electrolytic in them is very corrosive.

Tantalum tag (teardrop) capacitors are only really safe as timing caps. They have a horrible tendency to explode when used for power filtering. I stopped using them on power rails more than three decades ago, and I've replaced dozens of them that have exploded in many pieces of gear over the years. When they don't explode, they turn into dark cinders.

The capacitance is equivalent, but the ability to handle spikes of inrush current is not.

Beware when replacing electrolytic capacitors in Kenwood radios - I've found underrated caps used in the original designs of at least two Kenwoods so far (the audio output cap on the TS850 included) and always make sure that I put in caps that have a rating at least 30-50% higher than the highest expected voltage across the cap.

I really like my Kenwood radios, but there are some Kenwood engineers that need some reeducation - saving a few pennies using an underrated cap is "penny wise, pound foolish".

OK got the radio fixed. I found C104, 470uf 10v, cap had blown up. C104 is in series with the speaker at the output of the audio amplifier. The guts of C104 had eaten the AGC signal etch the runs near by. I paced the AGC etch with a short piece of 30awg wire and replaced C104 with a higher voltage rated part. Radio seems to be working fine now.

Dave,

Let me encourage you to replace C104 on the IF board. It is in series with the audio output. Don't let it outgas if it has not already. Leaving the crud from the old cap can damage the thin circuit etch on the board. This what caused the AGC circuit etch to open. The IF board is easy accessed by pulling off the bottom cover. I did have to lift the board up to unsolder the bad part an install the new one. I found I could remove the 2 flex strip cables and lift the board up for access after removing screws holding the board to the chassis. As recommended by others on the group I went to a higher voltage rated part than the 10 volt cap original.

Merry Christmas and Happy New Year!!

73,

Wes

Wes I think I looked at that board one time and saw the two din plug cnnections in the back and got cold feet. How do you handle them without having problems. Does that whole assembly come out with the board, plug and all.

Dave,

With the screws removed and the 2 ribbon cable disconnected you can slide the board back into the radio. At the same time lift the end of the board opposite the DIN connector. the board will slide enough that the connector will clear the chassis.

12526. adjustment of carrier point

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2013-12-30 04:53:51 UTC
From: <ve5ss@...>
Topic: 12526 Message: 12526

On page 44 of the service manual, items number 11 and 12 give a -40 t0+40 range with a default of 0. My 450 is set at LSB -5 and USB -20. I winder what I will accomplish to change the values??

I also seem to have a problem with ALC as the output varies and is not steady. After leaving the set on for a long time the ALC seems to settle down and I can tune my amp but do not get full output. I believe the ALC is folding back the output and only allowing about 50 watts out.
Does anyone have a suggestion for proper settings for the carrier point and has anyone ever done the changes suggested on the ALC board

12527. No TX on 24 & 28mhz TS-450s

Yahoo group: TS-850_450_690 (2010 — 2016)

Topic: 12527 Message: 12527

Hi all,

From times to times my trx doesn't TX above 21.500mhz. (24 & 28mhz)
There is nothing on the smeter, alc, swr meter, ... when the ptt is switched on.
The same problem on the all modes (am, frm, ssb,cw)
Just one thing, in fm the power supply debit the maximum current (30Amp). Also in cw, when the key is on or if I whistle in the mic in ssb. But no trace on the meter
Something seems to be grounded somewhere.

The reception is good on all bands
All the others bands are ok (TX & RX) (3.5 7 14 & 21) pwr output about 100w

What do I need to check ?

73s & HNY, Mark

So I'm and old time CW straight key operator. I want to get involved in some of the newer digital modes. Looked at TigerTronics, RigBlaster and others. Some have a CW keying circuit some don't.

Using TS-450S and Windows XP or 8.1 (depending on computer I use).

So please give me some suggestions on interface(s) and which (simple) software to use. Personal experience would be helpful in the discussion.

THANKS!
Alan, NY2G

Hi,

My DSP-100 which is connected to my 850 has a problem. The hf filter control does not function, whereas the lf control does work as do the rx and tx buttons.
The knob and wiring to it is ok. I am not sure what is causing the problem, the control used to work by the way.

Check the terminals on the print, 99% chance there is a bad joint
between one of the terminals and the print.
First I had broken contacts in the plug (of course that on with the 13
pins).
Later, after some time of testing, I noticed a vy thin line in the
solderjoint of the chassis part and the print...

Mostly caused by pressing the unit too firmly backwards against
something to line-up the frontpanel with the rig.

73 and succes, Joop / PD2JAM

Terry, I can't speak about all the questions you asked, however, last week I replaced C104. My 450s had gotten down to a very weak audio output. I still had headphone audio, but no speaker. Replaced C104 and cleaned the board, and it came back to life like new.

Good luck, let us know how it works out for you. I love the old 450s radios.

Topic: 12540 Message: 12540

Hello Folks, thank you for allowing me to participate with this group. I am "2nd" owner of a TS450SAT s/n 604000xxx original owner was my father, NX3Y. The rig, has served very very well, I have used it at home, portable, mobile, field day, virtually every possible ham radio circumstance. I would guesstimate, in the 20+ years in the family, it has been a part of 300k qso or more.

A few weeks ago, I was participating in one of the CW contests. I was put on the dx cluster as having clicks and chirps. a local radio buddy texted me via cell phone and emailed me audio. a definitive chirp. off the air I went, and immediately began troubleshooting and asking elmers a possible cause or route of troubleshooting. A more trusted one indicated it could be just as simple as frame grounding. so I ran a new #6 ground, from the rig to the black gas pipe, which is also tied to a ground rod driven outside. Tested it with a few stations, all reported no chirp, good clean CW.

3 days ago, while playing with the SKCC folks, and their K3Y anniversary event, I get a message that my cw audio is very chirpy. I check all ground connections, all are still intact. tested with another station, get a good clean CW signal report. now I am a lil baffled.

Today, while in qso, I was asked what model heathkit I was running, due to the chirp with the CW tone. in addition to that, I get a oo postcard in the mail, indicating a CW chirp. After Kenwood tech support tells me, if the factory reset doesn't fix it, I need to send it in for repair, I am consulting the experts, the folks on this reflector. I imagine some of you have run across this before. Please, any opinions, tips, tricks, are useful. Thank you for your time, and I apologize for the long read. best 73 Scott, KA3QLF

Hi Scott

I have a couple of TS-450's here and if I let the supply voltage get too low, they chirp. I have a couple of power supplies that have an adjustment knob, and a few times it has gotten bumped and turned the voltage down.

The TS-450's like a power supply that delivers around 13.5 volts or so. If mine gets down to 12 volts, it will start chirping. 73

Tom, I agree with you. I have also witnessed chirps etc with different rigs in the past due to power supply/low voltage etc. Scott, check the power supply for voltage and ripple under full load.

Just an opinion. Not giving any legal or engineering advice.

Forgetaboutit the chirp worry about the BOOM! You mention your GROUND is connected to a GAS PIPE.

By all that's holy and the National Electric Code NFPA Article 70 ANY electrical ground to a gas pipe is totally illegal!!!!!!!!!!!!

Besides possibly blowing up yourself and your neighbors, many times a gas main has a insulating sleeve to separate the inside line from the outside line, preventing a continuous ground.

GET YOUR ELECTRICAL GROUND OFF THE GAS PIPE!

Monitor your power supply voltage at the input to your rig. If it is too low or unclean that may be a cause of your problem. (IF you are still alive!)

Following the National Electric Code NFPA Article 70, local codes, and read any book on amateur radio that explains about grounding your rig and/or antenna system.

wow talk about scary. ok todays updates:

Ground bond removed from gaspipe. and re run. additional research revealed that technically the water heater hot and cold pipes should be bonded, so took care of that as I re-ran the rig ground wire.

I am using an Astron rs35M power supply. following many others advice, I checked voltage at the studs, 13.8Vdc and under 100W CW key down, it dropped to 13.72vdc

Voltage at the rig revealed same numbers.

unfortunately I do not have a scope so I cannot say how clean it is.

Thanks all for all the input thus far, fingers crossed as I prep for on air testing

Hi folks. This is a reach in terms of figuring this out but.....here goes. I have an interface, Rascal, between my TS-850S and laptop to run digital modes. The Rascal has a serial connector on it but the laptop doesn't. I use a USB adapter to take care of this. Everything works but........I have a low hum on my mic audio. In the process of eliminating the source, I discover when I disconnect the laptop from the USB adapter/Rascal interface, no hum. I have no idea what might be causing this. Laptop running on DC supply. I have not disconnected the PS and run the laptop on the battery. That is next.

Any ideas?

Hi all,
Well, I am still on the hunt for the elusive IF board for my TS-690S.
Common story: C99 & C101 both lost their innards and spread across the entire filter section eating all of the traces in the area. I have tried point to point wiring in an effort to get it repaired but to no avail.
In fact,

There are bare portions of the PCB where the electrolytic material was that appears to be slightly conductive. I have tried denatured alcohol plus other solvents to try to remedy this condition but with no joy.

I really need a new board. If anyone has one that they would be willing to sell me, please drop me a note off list.

I also need the Mic Gain Knob.

Many thanks es 73....

If your budget is tight right now, you can use the free version of Ham Radio Deluxe to tune your rig. You'd just need the CAT cable available on ebay and of course a PC.

Hi Alan,

I would like to offer my experience. I have the TS-450S and have been using digital modes for a couple weeks now with great success.
First, you do not need any special expensive interface hardware. All you need is a CAT cable and an audio cable to connect the TS-450 to the sound card on your PC. I got mine off of ebay for $45 for the set. Next, download a digital mode program such as Fldigi or Ham Radio Deluxe for it's Digital Master 780 Software. These programs can be obtained free of charge. I use Ham Radio Deluxe and Digital Master 780. The software can key up your radio via the CAT cable. If you want to do CW, select MCW (modulated continuous wave) for the software mode. The software will then generate the CW and send it via the audio cable to your ts-450 so no external keyer is necessary.

Hope this helps you,

Justin, N8QVQ
www.n8qvq.info

I have been using a TS-450 with HRD/DM780 for some time. It is not necessary to use MCW as DM780 will key the rig via the comm port. (There appears to be a lot of debate/disagreement on whether MCW is legal on the bands anyway so I avoided the issue.)

I suggest installing a second sound card. Let your OS have the on-board audio (since that's what it's used to) then the rig can have it's own dedicated sound card. This way you wont have to fiddle with sound levels when switching between the OS and DM780 (as they'll each have their own) and you wont accidentally transmit your OS default sounds.

I had an issue where I ran out of comm ports. The rig control interface needed one and so did the audio interface but the PC had only 1. To address that issue I added an Edgeport 2M serial adapter. From 1 USB port I now had 2 serial ports. (Comm 3 and Comm 4) Neither HRD or the audio cable appeared to care that they're not indigenous. Both the rig control and audio interface came from N8ST, DonnerStore.org. They don't appear to have the rig control interface any longer. Perhaps demand dropped off but the audio cable is still there.

This setup ran under XP and Windows 7. I don't know how Win8.x will handle it.

That's my story. Yours can differ.

if you have no luck, it seems to me that one of the DDS chips is only used for FM. A close review of the service manual might show that you could perhaps move one of the chips and fix your problem..

A larger project would be to re-engineer the CAR board using newer technology. It wouldn't be a trivial issue, but not as bad as it might look at first glance. A lot of the circuitry on the CAR board is there because the DDS chips used ran at a very low frequency by today's standards,
One would need a micro in there to convert the "instructions" comming from the TS-850 processor into something that the newer DDS chips understand.

I was actually kept awake last night, laying in bed thinking through these exact problems. I have a sneaking suspicion that a single modern FPGA could probably produce all four outputs simultaneously.

The flip side of that is those boards being double-sided SMT are already pretty dense. I don't really have the facilities to produce that high of density at any capacity at all.

I didn't really need another project right now but.....

Don't forget that an awful lot of the circuitry on the board resulted from the requirement to run the CAR chips at lower frequencies - & multiplying the results up to the final frequency.

The new DDS chips can generate the required frequency directly. As far as I could see, even generating the RTTY wouldn't be an issue. you will of course need room for something to translate the TS850 bus commands, but a middling size AMTEL AVR should do that quite nicely. Could likely even handle an ASCII to Baudot conversion at the same time <G>

Hi Group:
Thanks to all who responded to my question.
So here is what I accomplished so far...
Purchased "RigBlaster Advantage" from DX-Engineering.
Purchased mini-tower running Windows 7.
(Not hooked up to TS-450 yet.)
Running both MRP40 Morse Decoder and Fldigi (just to play around).
Input is not my radio... Using old ARRL morse code training tapes in cassette player!!!
Fldigi decodes better than MRP40!
Output is not my radio... Using old AMECO Code Practice Oscillator. AH HA! That's why I chose the RigBlaster Advantage... it has a keying relay/transistor (VOX) so I can send "real" Morse Code CW and not MCW.
Anyway... rig control will be easy. Have cables and everything else needed.
Time is big factor (busy time of the year for me) so in a month or two I'll connect to my rig.
I'll keep you guys updated.
73,
Alan, NY2G

Hi all,

A friend of mine has bought a TS850 he wants to use in AM.
Despite correct settings (output power at 30W set by CAR, correct MIC gain) the power is dropping instead of increasing when he speaks.
Any guess on what could be wrong ?
73, TK5EP Patrick.

Carrier power is too high and the ALC is pushing the power down on speech peaks. I always run the power output flat out and control the output on the carrier control. 25W is the highest carrier you can use in theory, but even if you reduce it to 10W you will still see some power reduction on speech peaks, this is normal on many rigs. My 7600 does exactly the same.

Kevin

Patrick,
I rarely use mine on AM but if I remember correctly, you should turn your CAR down to about 5-10 watts. At that setting, you see a forward movement of the output .

Hope this helps.....Dan

Your joking right?

I must be missing the question... AM no modulation = 100% carrier = full power...

Now modulate the carrier.... surly the measured power goes down, it cant go up can it?

G0JKN - Nigel

You don't want to run AM full power, or your radio won't last long. Consult your manual before you run AM if you are not familiar with it.

Hi all, Thanks for the different answers...
Well, just to be sure, i went to my contest QTH where i have 2 TS850s and made the test myself. It seems that about 25W is the maximum you can put with no modulation if you want a next to perfect modulation. Flat, as one fellow suggested, works just fine also.
It's difficult to be sure if my friend makes the right settings, he is about 600km from here, but i'm pretty confident he does...
NO, AM can't have full power with NO modulation. As AM for amplitude modulation suggests, the output power is varying with the audio signal. So in no case can the RF power go down with modulation, the modulation index can't be higher than 1 or you will overmodulate.
I suspect that my friend has a serious ALC problem.

73, Patrick

Hi Tilen

I have my TS-450SAT wired to the sound card in the computer to send SSB
to the radio.

The audio is the center pin of the mic jack. PTT is pin 6 and gnd is pin 7.

I use a home made interface with a couple of audio transformers to
isolate the audio into the radio from the sound card in the computer.
Works for SSB or for RTTY. 73

AM output power is the carrier power plus the sideband power. At 100% modulation, the output power will be twice the carrier power. The Kenwood manual suggests that carrier power can be as a high as 40 watts and the fully modulated output can be as high as 80 watts, but it seems that practical experience shows this to be not obtainable. It would be interesting to watch the output on a spectrum analyser, my suspicion is that the finals just can't handle the continuous load.

Hi,
I cannot read a word of what was said, but it looks like he ran a wire from the ground terminal to the
metal frame of the base. I see what looks like a 100 Ohm resistor has
been added to the mic socket?
What is the purpose of the resistor?

Dear Group,

An audio issue started on my 450 this week. Sounds like lightning crash static. Happens intermittently. When it occurs I hear it equally on all bands and all frequncies. It increases in volume as I increase RF and/or AF gain. Sometimes it appears to force the AGC to be affected as all normal stations instantly drop in amplitude for several seconds at a time by many s units. Disconnected everything from the rig except power...still there. Switched from a power supply to a battery...still there.

Any ideas? Thanks very much.

I don't have my service manual handy, so I may be completely off base here.

The Yaesu FT-857 has a similar symptom when the ceramic IF filters fail. Yaesu made a design error and applies the diode switching DC to the filters, against the manufacturer's recommendations. It's a common failure, and causes the same static crashes. Check for resistance on the input and output pins to ground. Should be tens of kilo ohms. The faulty filter's I've replaced have been a few ohms. The AM filter is the culprit, but it affects SSB as well. The filters are a few dollars (small Toko 455 KHz ones). I'm not saying there's a flaw in the Kenwood design, just that they have similar symptoms to your problem.

Good luck
Dave AA3EE

I believe you're hearing the effects of intermittent DC as a capacitor (mostly likely a coupling cap) is breaking down.
SInce the level varies with AF and RF controls, it is most likely in the IF or AGC cktry.

If you are fortunate, you might be able to trigger the noise by tapping on any suspect caps. You might provoke the same effect by tapping on the filter cases also, but I won't guarantee you success.
I don't recall having heard of or seen one of those Murata filters go bad, but there's always a first time....

I don't have my service manual handy, so I may be completely off base here.

The Yaesu FT-857 has a similar symptom when the ceramic IF filters fail. Yaesu made a design error and applies the diode switching DC to the filters, against the manufacturer's recommendations. It's a common failure, and causes the same static crashes. Check for resistance on the input and output pins to ground. Should be tens of kilo ohms. The faulty filter's I've replaced have been a few ohms. The AM filter is the culprit, but it affects SSB as well. The filters are a few dollars (small Toko 455 KHz ones). I'm not saying there's a flaw in the Kenwood design, just that they have similar symptoms to your problem.

Good luck
Dave AA3EE

---In TS-850_450_690@yahoogroups.com, <tjwaraksa@...> wrote:

Dear Group,

An audio issue started on my 450 this week. Sounds like lightning crash static. Happens intermittently. When it occurs I hear it equally on all bands and all frequncies. It increases in volume as I increase RF and/or AF gain. Sometimes it appears to force the AGC to be affected as all normal stations instantly drop in amplitude for several seconds at a time by many s units. Disconnected everything from the rig except power...still there. Switched from a power supply to a battery...still there.

Any ideas? Thanks very much.

73,

Tom AF8P

From: Zack Widup
Topic: 12595 Message: 12595

Hi,

My TS-850 has developed a problem and I thought maybe one of you might know where to look. It mainly shows up on CW but the problem is there on other modes.

Usually, when I first turn it on after it's been off for a while, it seems OK. Then, after a while, signals start to sound raspy on receive. When I transmit, people tell me my signal sounds raspy, almost like raw AC on CW. The problem just started again a few minutes ago, so I listened to some SSB and AM signals and they all sounded raspy, too, so it affects everything.

I've been using a PS-50 power supply for almost 20 years with the radio. The power supply has been fine. I haven't tried swapping out power supplies to see if that takes care of it, but I suppose that's the first step to take. I just wonder if I should look into any other areas, too.

Need more info , giving us the ser. # , because of the issue with
counterfeit
capacitors in the early numbers , if I remember 6 million or less .
Then if earlier the issue of caps damaging the chips on the carr board .
You should have a collection of notes , repairs , issues etc. for internet
searches , then read through those to see if any issues have a regular
known occurrence and repair .

It wasn't exactly counterfeit caps, but a bad electrolyte mix that was fraudulent...
When I have noticed that raspiness, it has usually been a VCO that needed tweaking, but a leaky cap can show the same symptoms....

Try the VCO adjustment first....

I got it. Thanks. But the article says the problem started in 2002.
The TS-850 was produced from 1989 - 1996???? Were there issues with
capacitors earlier than the article reported. Not doubting. Just never
heard about it.

almost like raw AC on CW. The problem just started again a few minutes
ago, so I listened to some SSB and AM signals and they all sounded
raspy, too, so it affects everything.

I've been using a PS-50 power supply for almost 20 years with the
radio. The power supply has been fine. I haven't tried swapping out
power supplies to see if that takes care of it, but I suppose that's
the first step to take. I just wonder if I should look into any other
areas, too.

I do not have the article memorized , so not sure of your 2002 reference ?
As memory goes , something like , it started about 30-40 yrs. that
counterfeit caps were being sold across the board to all kinds of products
and it could take a number of yrs. as many as 20 + or - before the affects
- leaking would show its self .
So that could be why some question of yrs. , when there were
manufactured , sold to appliance manufactures and 20 yrs. later when repair
shops started seeing the results and backtracking the whats & whys .
At least that is how I remember , not going to re-read the wiki at this
time .

A common problem. I had it with my TS-850 as well - after it had sat on a bench with almost zero operating hours on it for about 10 years. A search on the internet for TS-850 and VCO should bring up a lot of info.

The likely problem is that the main VCO trimmer needs to be adjusted. Lots of documentation on the internet on how to do that. In my case, it fixed it for a while, and then a shorter while..... etc
Thr trimmer looks like a 10 cent plastic job - it's a real pain to replace if you are not comfortable raging around inside your radio. What I ended up doing (with a lot of trepidation) was replacing the trimmer with a surplus piston cap. Worked like a dream - but getting the VCO module off the board needed a significant soldering iron - the old fashioned variety.
There are a number of VCOs one the same board, and it would probably be worth checking that they are all aligned. The service manual has the procedure. For some reason, the caps on those VCOs don't seem to cause problems.

That's my understanding as well. Additionally, some of the caps in the 780 appear to be a little under spec'd and should be replaced. A search on the internet reveals articles talking about a number of them. When I had to replace the battery in the TS-850, I replaced all of the CAPS in that part of the radio as well. It would also appear that replacing the Surface Mount caps on the CAR board is a wise investment and the audio output cap seems to have a bad rep as well.

I did buy the replacement CAP kit from the VE3 gent who advertises on eBay, but haven't go around to replacing the rest of the CAPs. The DX100 was a LOT less stressful to work on <G> as long as I remembered to drain the power supply caps before sticking my fingers in <G>

Thanks Villy. What's puzzling to me is that when I first turn on the radio, it's fine. I sat and listened last night (didn't transmit) and the harsh sounding tones on received CW didn't start till about 35 minutes after I turned the radio on. But when I transmit, it seems to come on faster. It starts in 10 or 15 minutes in that case. So I'm guessing heat enters into it. On transmit, more heat is being generated in the radio. This morning, I had it on for about 5 minutes before I left for work and it sounded fine again in that time period.

I might as well do the capacitor overhaul and also replace the battery while I'm inside it. Hopefully I will get some more years of use out of it then.

Counterfeit parts - from capacitors to integrated circuits and beyond - have been a problem for many years. ICs that have been removed from circuit boards, and re-marked - often with speed or temperature ranges that don't match the original part - are common. Substandard capacitors became rampant about 10 years ago, so bad that the Abit company (motherboard manufacturer) went out of business. (I was an unfortunate customer - Abit built really great motherboards until they were sabotaged!)
More nefarious things have occurred, it's likely one of the reasons that Intel built a new North American manufacturing plant, I'm willing to bet that they're getting a lot of government contracts, when most silicon is being produced in parts of the world that aren't all that Western-friendly.
There are supply-chain standards and processes to help alleviate this, and I would suggest that for anything that you really value that you obtain your parts from reputable vendors that have good supply-chain management (in North America, this means most of the big ones like Digi-Key, Mouser, Arrow, the Farnell affiliiates and such), and don't trust the cheap caps from Asia. (Fine for prototypes and throw-aways. I buy them too, for these purposes, but never put them in my rigs! :-)
I pay the small premium for parts when they're going into my cherished rigs (and the rigs of friends).
I work for a large, US-based high-tech company, and following security issues is part of my job. If you think that I'm being paranoid - this is me at my least paranoid, 'real life' is far more serious than ham radio - but personally, I intend to keep my rigs working too!
For the amount of work that goes into a typical rig repair, the cost of validated parts is insignificant. If you're paying someone else to do it - infinitesimal! My real peeve is that Kenwood, over the years, has put underated parts into some of its circuits and this has bitten me on more that one occasion. Such parts will often work for years and then eventually die from too much 'bruising'. There's no excuse for poor engineering. 5 volt parts in 5 volt circuits - or 10 volt parts in 12 volt (inductive) circuits! This should never happen. It's capacitor roulette - sooner or later, they're gonna die. The audio output circuit of the TS-850 is a perfect example. Using a 10 volt cap for AC decoupling of the speaker on a 13 volt power line? If your TS-850 hasn't died yet, put in a 25 volt cap now before it goes... It almost certainly will.

The serial number on my unit is 40400336.

I took the covers off but haven't gotten to the CAR board yet. It seems there is a lot of emphasis on replacing the caps on the CAR board. Are there any others on other boards that are likely to go bad? Looking over the boards that I can see without disassembling anything further, all the caps on those look good and are not leaking.

I did a few mods to it some years ago. I opened it up for transmitting across the shortwave spectrum, because that is the only way I knew to make it transmit on the 60 meter band (fun band!). I also bypassed the internal BCB attenuator per instructions I found in several places. I didn't do the noise blanker mod, so I might as well do that while I have it apart.

My thanks to Clif at AVVid. I described the symptoms to him off line and he diagnosed the problem perfectly. C104, an aluminum electrolytic, had failed and was leaking and causing havoc in the area of the three 455Khz IF filters on the IF board. Thanks again to all.

Tom, I'm glad you were able to figure it out. For anyone searching the thread in the future, you test the filters in circuit. They should have input and output coupling caps, so should show infinity to ground, or at least more than 10K ohms. Out of circuit, they show infinity to ground. The Toko filters I pulled from a Yaesu had corrosion inside. They were small plastic cased ones. Someone online actually took one apart and cleaned it successfully. For $4, it was easier to replace :-)

I'm using a DSP-100 with my TS-850. It has been running great until recently. After a bit of time, with the RX button engaged, the receive audio drops out. turning the RX button off then on again will sometimes clear the problem. But as time goes on, it seems that doing this becomes less and less effective. I'm guessing a heat problem? Does anybody have an idea where I should start looking?

Kurt,

First thing I would check is the power supply. Put a scope on the supply lines if possible and check if they are clean and free of ripple. CN2 on the psu output is where you want to be looking. The supplies are 8V and 15V.

Re-solder all the connectors at the motherboard.
Known item is that all the connectors are placed directly on the
motherboard, and all the force used of putting/pulling plugs is a
direct hit on the solder connections.
Do the switches as well!

Jordan,

A 470uF, 10v was in there. I don't have a schematic for the IF, so I don't know how the cap is used or what the typical ckt voltage is for C104. 16V would not be a problem to find.

I looked for a schematic in the group archives with no luck. Thanks.

Thanks Dave. Since the leaky cap, C104, is right next to the three 455khz crystal filters, Clif recommended removing all three filters, cleaning them and the pcb under them and confirm all tracks and vias are not damaged. Hoping for success. Thanks to all. I will post more if I find anything else. 73,

Tom, I'm glad you were able to figure it out.

For anyone searching the thread in the future, you test the filters in circuit. They should have input and output coupling caps, so should show infinity to ground, or at least more than 10K ohms. Out of circuit, they show infinity to ground. The Toko filters I pulled from a Yaesu had corrosion inside. They were small plastic cased ones. Someone online actually took one apart and cleaned it successfully. For $4, it was easier to replace :-)

I'd actually recommend a 25 volt cap in that position - it's a 13 volt rail driving an inductive load (the speaker).

TS-450S Alignment Cable for setting 10 MHZ frequency.
Anybody have an extra alignment cable for the TS-450S?
Or, is it a straight through cable that I can make or is it something special?
I know there was a Kenwood official change in the cable and connections and I have that service advice, but I still need a cable or schematic of one.

I have the original cable. It’s just a piece of insulated wire with a plug on each end that will fit over the pin on the pc board. When I couldn’t find the cable, I used a “clip-lead”. My radio’s serial number is 601xxxx, so I’m not sure why I don’t have the updated cable referred to in the service bulletin. Maybe they installed the capacitor in later models and went back to the old cable??

Hello
Just noticed an issue with my TS850 When on FM I am getting the following readings under the red ALC bar

10m 50
12m 50
15m 60
17m 125
20m 25
30m 60
40m 50
80m 125
I have to keep adjusting the CAR button does anyone know what is causing this and if it can be easily corrected? Power output is constant, does not rise and fall, had caps done not so long ago.

Thanks
Pete

Topic: 12632 Message: 12632

My 850 is fitted with the DRU and it works fine with paddles connected and the built-in keyer enabled. I got new paddles and decided to try the "BUG" mode in the initial settings menu (#24) and I was surprised to find that the DRU memories did not work anymore.
As soon as I switch the "BUG" mode off, the DRU memories were working.
Has anyone had this experience, and is there a work-around to have the DRU messages available when the "BUG" mode is enabled ?
Thanks
Joe WR2B

My M.CH/VFO.CH knob has become almost useless unless I want to go 5 up or down, no more - no less. I've taken apart the encoder and stripped it down to the PC board to no avail. I've come to the conclusion that it's not dirty, just worn out.

I've searched this group, checked East Coast Transistor and other parts houses but no one seems to stock this part any longer. Does anyone know of a suitable replacement? Did I miss a supplier? Do I have to buy a "for parts only" unit?

Standing by for any call...

Frank.

I also think it can be just dirt dust or loose screw tightening , this is determined by wear of the potentiometer , it may be broken, I had the same problem but frank potentiometer slope -tune high low , the engineer who had viewing had diagnosed the rupture of the potentiometer , it was enough , however, the flux and cleaning with a good grasp and the defect is gone, in my case arrived at the end of the race tightening knob jumped erratically on the audio receiver , sometimes it 's passing of years and should be replaced , I believe that with a little luck you can find the ebay replacement for Frank , the only thing is the greatest calm and precision in assembly and disassembly of the entire part of the radio, you are likely to do harm unintentionally , so I happened to small buttons on the display , it was enough to watch a video on youtube, if you disassemble the front of the radio (it is not necessary as airtight) you have to put the tS -850 or similar pointing inwards towards the ' other.
good vision :

12649. Intermittent receive problem - TS450S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2014-04-02 23:57:10 UTC
From: Andy - KU4XR
Topic: 12649 Message: 12649

Greetings all: My first time posting to the group.. Hoping to draw from the collective knowledge..
I have the 450S, and it had started dropping out on receive intermittently.. I could jiggle the coax
connector and it would come back on.. I assumed the wire from the connector to the board was
unsoldered, and was correct.. BUT; that did not solve my intermittent receive drop-outs..
After dismantling the rig, and doing much needed cleaning, and maintenance on the inside; I put all the boards back in the rig, and powered it up,, Wah-Lah.. Nice receive.. For A Few Minutes..
then off it went... It does not affect the TX when this happens.. And here is the only peculiar thing
that " might " shed some light on the problem.. I can press the " AIP " button, and it receives !!
Turn the AIP off, and the receive goes away again... I repeatedly pressed the AIP button and the
normal receive came back on... After a short time, it dropped out again... I pressed on every
connector, and board in the rig.. Did the usual " tap -tap -tap " on boards, and components to see
if it would come back on... That accomplished nothing.. Eventually the receive came back on, and
has stayed on for almost an hour as of the time I am typing this post... I have quickly switched
through all bands... up, and down, over, and over, and the receive is holding in there.. BUT !! I am
not convinced yet that the problem is solved, and am hesitant about putting the casing back on
the rig...
One More Thing to mention... I discovered that the surge diode had also come loose from the board..
I discovered this by gently pulling on the wires on each end with needle nose pliers.. The ground
end pulled right out of the board.. I repaired that problem, and that is when the receive has stayed
on..... Still not totally convinced though... " QUESTION " Can that surge protector being loose
on the board cause the intermittent receive drop-outs ?? My mind don't think so.. because the
" AIP " should have no effect on receive if that is the case...But, I may be wrong...
I eagerly await any and all replies, and suggestions...
Thanks Gentlemen, and 73 :

Andy - KU4XR

Andy, more than likely C104 or C103, I can't remember which is leaking. Mine did the same thing. I got a package of 10 replacements for a few bucks off Ebay and replaced the leaking cap. Problem solved. You might look back thru the files section on this website and I think you will find the fix. Board comes out easily and it is easy to replace. Or google this problem, only thing I'm not certain about is the C104 or C103 number.

Andy,

I had a similar problem with my audio. It was a leaking C104 on the IF board (next to the TO220 heatsink with clip). This is the decoupling cap that feeds the speaker, but leaked on the board and started to effect all three IF crystal filter circuits. I had to replace the cap and then remove and clean under each of the three crystal filters where the cap leakage had gone. I removed the TO220 heatsink also to make this process easier. I have pictures if you need help finding the part in question. All this was done with the help and advice of Clif at AVVID on this group.

From: Andy - KU4XR
Topic: 12649 Message: 12652

Hello again all:.. Thanks to Dave, and Tom for the info on C104.. I checked mine visually and there is no leaking, or bulging of the cap.. I tapped on it to see if it affected the audio,
and it didn't.. I pulled upward on it to see if it was possibly loose in its solder joint, and it
is solid on the board.. I won't say that it's not the problem, but to clarify a bit more on my
earlier post.. First, It is still going dead, at random times.. Now by dead, I mean " All RF "
the radio goes completely silent.. No meter movement, no audio hiss, tune to a local radio station, and hear nothing at all.. It's as if the RF board just goes dead.. BUT.. push the " AIP " button and the receive comes on, push it again, and it goes off.. I can't find anything
specific that seems to cause the radio to start receiving again, OR, to stop receiving, it just does it randomly.. I hope this post describes a bit better what is going on with my rig..

Again, thanks for any, and all replies ... 73 :

Andy - KU4XR

Andy, I would reseat all he screws holding the board to the chassis, in case you have not tried that. Also, if the AIP button is suspect, try DeOxit on it. An intermittend is harder to find than if it downright quits. I have a 430s several radios back that reseating all the board screws brought it back to life. Hopefully it's just something simple that won't cost an arm and leg to fix.

From: Zack Widup
Topic: 12655 Message: 12655

I finally got around to doing everything I wanted to do to my TS-850 this weekend. When I got to the CAR board, I found that eight of the ten 10 uF electrolytics had leaked onto the board but no board circuit traces were damaged. I replaced all of the 10 uF caps. The 47 uF cap looked good but I replaced it anyway.

I replaced the solder-in coin battery with a battery holder fastened to the aluminum wall at the front of the radio just above the noise blanker board. I can easily get to the battery there. But I am surprised I have had the radio since 1997 and never needed to replace this battery. It had not leaked and still measures 3.08 volts.

I did the noise blanker mod too.

Finally, I aligned the VCO's. It seems the LO2 VCO was the culprit in causing the harsh CW tone I've had reported as having. When I measured the voltage at the test point, I measured 2.6 volts. I set it to 5.0 volts and all is well now (no more harsh tone).

Are there any other capacitors I should pay attention to as possibly leaking or needing replacement?

On the 450 there's some caps surrounding some driver IC's in the auto tuner. I haven't pulled an 850 tuner to see if it's plagued too.

I've also been putting a couple mH choke across the glass arrestor bulb to eliminate static build up on the antenna port.

Hi Zack
I found that the tweaking the LO2 vco cap was a temporary solution - one that became more temporary as time passed. One never knows though - you might have better luck than I did.

I am told that the audio electrolytic is one that should also be replaced. I replaced all of the electrolytics in the front panel and the CAR board - I figured that since I had it apart, I might as well bite the bullet. I bought the replacement capacitor kit from the ham on E Bay, but haven't got around to changing any more. There was no sign of leakage anywhere.

I think that the RF choke across the antenna terminals is a good idea. I did that same.

Thanks Villy. I'm keeping an eye on the LO2 voltage and if that capacitor acts flaky, I have a small 10 pF piston trimmer with tabs that will fit just about perfectly in that space.

I didn't touch the front panel other than to pivot it out to get to the board with the battery on it. Hopefully those caps are OK.

I didn't see any leakage from any other caps that were visible.

Made some CW QSO's last night and everyone said I sounded fine.

Zack,

I have two TS-850SATs here, one in the 30 mil s/n range and the other in the 50 mil range.

The 50 mil one has never had to have any capacitors replaced but I have had to replace several on the 30 mil one. On the 30 mil one, I have had to replace all of the electrolytics
on the carrier board (9 of the 11 were leaking, but no damage to the board).

I replaced all three electrolytics (C7, C8, and C18) on the display board after finding what
appeared to be a slight bit of leakage around the (+) lead of C18. The slight discoloration may have been from something else but decided to replace all them while I was in there.

C187 on the IF board (audio section) failed (bad odor and rumble in audio) so I replaced all
four caps associated with that stage while I was in there (C187, C167, C182, and C184).

I've also done the noise blanker, cw sidetone, and battery relocation mods.

All of the new caps I put in came from Mouser.

Alan, How did you like the cw sidetone afterwards? My only complaint about my 850 is the crappy sidetone and lack of adjustability (level) from the front panel. It allows you to change the sidetone freq but not the level. I never understood that.

Last year at field day I didn't have a very good speaker so the sidetone was terrible. I use headphones 99% of the time on cw but sometimes I feel like using the speaker.
At home it's acceptable at best.

Anyway, did that mod increase the level?

Bob, I highly recommend the cw sidetone mod. I don't know why Kenwood didn't incorporate this feature originally. Here are the component specs and the Mouser part numbers in case you buy the parts from them:

capacitor: 0.1 uF, 50v, Y5U, +/-20%
140-50U5-104M-RC

resistor: 330K +/- 5%, 1/4W, carbon film
291-330K-RC

It's been several years since doing the mod and I don't recall just how much the the level was boosted but I believe you will be pleased with the result. I just checked the 30 mil TS-850 and the level is adjustable from being not heard at all up to being painful.

73,
Alan, KD5R

Subject: Re: [TS-850_450_690] TS850 tune-up

Alan, How did you like the cw sidetone afterwards? My only complaint about my 850 is the crappy sidetone and lack of adjustability (level) from the front panel. It allows you to change the sidetone freq but not the level. I never understood that.

Last year at field day I didn't have a very good speaker so the sidetone was terrible. I use headphones 99% of the time on cw but sometimes I feel like using the speaker. At home it's acceptable at best.

Anyway, did that mod increase the level?

Zack,

I have two TS-850SATs here, one in the 30 mil s/n range and the other in the 50 mil range.

The 50 mil one has never had to have any capacitors replaced but I have had to replace several on the 30 mil one. On the 30 mil one, I have had to replace all of the electrolytics

on the carrier board (9 of the 11 were leaking, but no damage to the board).

I replaced all three electrolytics (C7, C8, and C18) on the display board after finding what
appeared to be a slight bit of leakage around the (+) lead of C18. The slight discoloration may have been from something else but decided to replace all them while I was in there.

C187 on the IF board (audio section) failed (bad odor and rumble in audio) so I replaced all
four caps associated with that stage while I was in there (C187, C167, C182, and C184).

I've also done the noise blanker, cw sidetone, and battery relocation mods.

All of the new caps I put in came from Mouser.

Sent: Sunday, April 06, 2014 3:22 PM
To: TS-850_450_690
Subject: [TS-850_450_690] TS850 tune-up

I finally got around to doing everything I wanted to do to my TS-850
this weekend. When I got to the CAR board, I found that eight of the
ten 10 uF electrolytics had leaked onto the board but no board circuit
traces were damaged. I replaced all of the 10 uF caps. The 47 uF cap
looked good but I replaced it anyway.

I replaced the solder-in coin battery with a battery holder fastened
to the aluminum wall at the front of the radio just above the noise
blanker board. I can easily get to the battery there. But I am
surprised I have had the radio since 1997 and never needed to replace
this battery. It had not leaked and still measures 3.08 volts.

I did the noise blanker mod too.

Finally, I aligned the VCO's. It seems the LO2 VCO was the culprit in
causing the harsh CW tone I've had reported as having. When I measured
the voltage at the test point, I measured 2.6 volts. I set it to 5.0
volts and all is well now (no more harsh tone).

Are there any other capacitors I should pay attention to as possibly
leaking or needing replacement?

Alan, Thanks. I have mine turned all the way up which is barely OK with headphones but is sometimes a problem with my Kenwood speaker, and like I said, at field day outside, no way loud enuff with a speaker.

I have an older Icom that the sidetone varies with the AF on the front. The inside adjustment basically is adjusting the ratio between the AF vs sidetone level. I wish Kenwood would have done that.

I did forget to mention that when I use headphones, they are the 900 MHz wireless type so the AF volume is set accordingly on the rig and the AF on the headphones set. All this does change the ratio of the sidetone vs AF.

Did I describe that well enuff?

Zack,

The other known suspect caps are in the digital display unit, almost as notorious as the CAR board caps, and the large uF cap In the audio stage. These are documented on various web sites.

I have my 850 open.just finished the CAR board, and will be going after the audio and display board caps shortly.

Oh, same story on my battery. No leaks, still going strong . Go figure.

Hello all: I have tried all the suggestions, and tips, and am still having the intermittent dropout of the receive. As I mentioned in earlier posts, pressing the " AIP " button will make the receive work at 10 dB down, which is what the " AIP " is supposed to do. Contacting Kenwood support about the issue, and a Tech emailed me, and told me that this is not an issue that is common the the TS450S, and recommended a Master Reset. Doing so, did nothing but erase all my memory settings. One morning after an overnight run on 160 meters WSPR, I manually entered an A.M. radio frequency, and heard nothing.. I tried another frequency, and the same. Only a slight sound from the speaker.. I turned the power off, then back on, and the radio came to life with the radio station booming in as usual. This is another first for the aging radio.. From everyones experience with this radio, Has anyone had issues even similar to mine, and it ended up being the Controller Board ? Thanks for any replies.. 73 to all : Andy , KU4XR

Hi Andy,

This kind of problem is hard to find. Sounds like, to me, it is a lose connection somewhere. When you lose receive are you able to transmit full 100 watts out with low SWR? If so does your receive come back after that? I have seen where some had a problem with solder joint from circuit board to SO239 not making good connection. Best I remember there is a wire from board to antenna connector.

From: Jose V. Gavila
Topic: 12672 Message: 12672

Hi all,

I am dealing with a TS-850 ATU problem. It does not tune on several (most) bands properly, and keeps hunting (moving the tuning caps up and down fastly). The rig has properly setup CAR and PWR controls, generating around 10W when trying to tune. It works fine otherwise, with a close to 100W output. But even on a dummy load, with 1:1 SWR without tuner, it is not able to tune, and keeps hunting with a 1.5 SWR indication on display, slightly up and down when caps move.

I have checked the TC1 alignment, and it is OK, set to a minimum of VSR voltage with a dummy load and full power TX. I have also checked the relays, and all work as they should. I have done a RESET of the rig also.

Any further hint?

Thanks and best regards,

JOSE

>> I have seen where some had a problem with solder
>> joint from circuit board to SO239 not making good connection.

That was an issue, but was repaired, and did not help the receive loss problem..

>> When you lose receive are you able to transmit full 100 watts out
>> with low SWR?

Yes.. After fixing the loose connection on the Filter Board, the rig will TX in all modes, at full power, and normal SWR readings for my Windom.
All other controls function as they are supposed to..

>> If so does your receive come back after that?

Sometimes it does, but usually only for a few seconds before dropping out again.
Then there are times that the receive does not recover after transmitting..
It always receives if I have the Advanced Intercept Point " AIP " engaged, on all bands , and all modes..
I can cycle between AIP on, and AIP off,a few times, and the receive will occassionally come back on in normal, (AIP off) mode.. The same is true with cycling between TX, and RX a few times.

>> This kind of problem is hard to find. Sounds like, to me, it is a lose
>> connection somewhere.

Definitely hard to locate.. I have either unplugged and replugged every connector that I can get to, and those that are hard to reach, I have wiggled them back and forth with an insulated tool..
I have pressed on every circuit board to no avail, And even touched up the solder connections on the RF board on the transistors for the NFB Amplifier.. This is the stage that the " AIP " button switches between.. AIP-off engages a 20 dB preamp, and AIP-on runs the signal straight thru.. The solder touch up had no effect either..

>> Reed W4JZ

Hi Jose!

Just a hint:

I've read in the past abouth some issues of mechanical order.
Pse check if there is no friction between the motor and the tuning part.
In some cases the screw for coupling the motor to the axle went loose!

If the electrical part is allright... it must be mechanical?

Happy Easter!

Oh my, I just deleted a long rant! I would look for the obvious capacitor leakage problem. If you cant see any obvious deteriation take the radio to some one who has the correct tools (sig gen and scope etc) you need to find the problem area with tools not poking around ;)

obvious signs are expanded or split cases, also look around thier bases for discolouration or leakage. These radios are well known for failing capacitors.

That was an issue, but was repaired, and did not help the receive loss problem..

>> When you lose receive are you able to transmit full 100 watts out
>> with low SWR?

Yes.. After fixing the loose connection on the Filter Board, the rig will TX in all modes, at full power, and normal SWR readings for my Windom.
All other controls function as they are supposed to..

>> If so does your receive come back after that?

Sometimes it does, but usually only for a few seconds before dropping out again.
Then there are times that the receive does not recover after transmitting..
It always receives if I have the Advanced Intercept Point " AIP " engaged, on all bands , and all modes..
I can cycle between AIP on, and AIP off,a few times, and the receive will occassionally come back on in normal, (AIP off) mode.. The same is true with cycling between TX, and RX a few times.

>> This kind of problem is hard to find. Sounds like, to me, it is a lose
>> connection somewhere.

Definitely hard to locate.. I have either unplugged and replugged every connector that I can get to, and those that are hard to reach, I have wiggled them back and forth with an insulated tool..
I have pressed on every circuit board to no avail, And even touched up the solder

connections on the RF board on the transistors for the NFB Amplifier.. This is the stage that the " AIP " button switches between.. AIP-off engages a 20 dB preamp, and AIP-on runs the signal straight thru.. The solder touch up had no effect either..

They have cheaper options - although I haven't yet tried the 'non ozone depleting' option:

12678. TS-450S:Hearing signal on both upper and lower sidebands. Also no 500Hz filter operation

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2014-04-18 16:19:43 UTC
From: Bob Bruno - K2KI
Topic: 12678 Message: 12678

Hi all,
I have a TS-450S which had the dreaded IF board cap failures plus a few horrible attempts from the previous owner to fix eaten traces mainly in the audio out section.
(You might have seen earlier posts from me looking for this unobtainium board)

I replaced all of the caps in the area with higher voltage rating ones (25V) and had to repair many traces that had been eaten with #30 Kynar wire-wrap wire. I removed all of the crystal filters and cleaned under the boards and did a visual on the filters. All seemed ok.

Now I find that on the "thru" setting, I am able to copy any signal on both upper and lower sidebands. I am also not able to select the 500Hz filter. It goes to the filter according to the display but no sound from the speaker. I did a factory reset and re-enabled the filters that I have installed (full boat complement) but no joy.

I also repaired the horrific previous attempt to repair the previous owners work with the same #30 Kynar wire.

So it might seem that I have two issues but maybe only one. I am unsure.

When I first got this radio the entire area where the crystal filters are were covered with the capacitors goo. I cleaned and cleaned but found the area to be slightly conductive (measured from any trace in the area to an empty section of the PCB). I finally got real aggressive with Denatured Alcohol and intense scrubbing with a synthetic scouring pad. This cured the conductivity issue but nothing else. BTW. I did the cleaning with all of the filters removed.

I am at my wits end. Has anyone experienced this sort of behavior with this model radio?

Any help would be greatly appreciated. In fact, I will offer up my first born son! (He's 23 and is a couch potato but he's real good with the XBox and a good kid nonetheless). :-)

Topic: 12672 Message: 12680

Hello Joop,

Thanks for the hint but not, mechanically it is sound.

But, menwhile, I have found the failure. At least I know which board fails on the ATU module. I have on my parts stock a new-in-box TS-850 ATU, so I tried with it and it worked flawlessly. So I was sure the fault was on the ATU module.

Well, I checked all relays, one by one, even desoldering them from the PCB (here it pays to have a professional soldering station :-)). All were working perfectly. I checked also the position potentiometers and the variable caps motors, which were also fine. So the only remaining 'big' item was the control board. I had also an unworking ATU, taken from a TS-850 parts unit. I knew it had some bad relay(s), but the rest was OK. So I have changed the control board from the parts unit to the other one... and the 'Franken-tuner' works perfectly :-)!

So the problem was on the control board. I have done some checks before replacing it, and the problem is that the system gets stuck in a 1.5:1 position, and the hunts up and down indefinitely. I have fooled the ATU by lowering the power (using CAR) on that moment, so it went out of the loop. And, sometimes, when getting back to normal tuning power, it found a good match.

There seems to be some problem on the comparison system, which has an spot which fails to find a solution, so to say.

As I was in a hurry to get the unit going, I have left it with the replaced control board. But, someday, I will investigate at component level what is happening.

I have found several similar problems depicted on YouTube videos, so perhaps if I find the fault, it would help others :-)

Best regards,

JOSE

Watch out with alcohol - 91% Isopropanol is the best to use for electronic cleaning. The other 9% is pure water, and when the alcohol evaporates it doesn't leave a residue. 99% isopropanol contains benzene (necessary to remove the water) and can leave a residue behind. 'Denatured' just means made toxic (undrinkable) but doesn't tell you what else is in the alcohol that may be left behind (including the agent that made it toxic!).
I learned this many years ago from an IBM Customer Engineer who was cleaning tape drive heads with alcohol - the only type authorised for this was 91% Isopropanol. I've had good success with this ever since.

Hi group
I got a DSP-100 without any cables.
I looked in the servicemanual where the pinouts are described J1 and J3.
Also have the Kenwood Miscellaneous manual, where Kenwood pinouts are described for several devices.
J1, ACC plug seamed to be connected 1:1 with pin2and 3 and 4and5 crossover , but J3 the DSP-3 with 13 pinouts I dont find a schematic.
Does anyone have this
tnx 73 Alex, OE3JTB

Topic: 12685 Message: 12686

Hi once more
got a link to the TS850 servicemanual, there I found the pins
13 PIN
TS850
1 DAF1
2 GND
3 DAF2
4 GND
5 DBC
6 RTK
7 CTK
8 MAG
9 GND
10 REF
11 MAO
12 MAG
13 TXB

DSP100
1 DAF1
2 GND
3 DAF2
4 GND
5 DBC
6 RTK
7 CKY
8 GND
9 REF
10 GND
11 MAO
12 MAG
13 TXB

6 PIN
TS850
1 GND
2 TXB
3 RXD
4 CTS
5 RTS
6 NC

DSP-100
1 GND
2 TXB
3 RXD

4 CTS
5 RTS
6 NC

So 13 pin cable straight trough, except pin 9 and 10 crossover, 6 pin 1:1, 2/3 and 4/5 crossover.
Or is it nessecary to crossout other pins?

Yes, it was pretty close. And, yes, I also used the 'reduce CAR trick'
to force a good match :-)

I ended replacing the tuner control board, but first I had also checked
TC1 and it made no difference. It seems the problem could be on the
diodes, even if they measured OK on circuit. I will check them carefully
when I have some time.

Regards,

JOSE

Every once in a while the auto tuner in my TS-850 can't find a match and will "hunt". I will be operating portable when this occurs. I verify that the SWR is 3 to 1 or less, then I place the antenna tuner in Manual Tune Mode and manually tune for a good match. The proceedures are on Page 30 of the Owner's Manual.

Topic: 12690 Message: 12690

I've used a number of TS-850's and they all seem to suffer from "drifting" if the tension is turned down on the tuning knob because they aren't balanced. One of the rigs did have a nice tuning knob that required no additional drag to make it stay put, but I have no idea where the original owner got that knob.

So, does anyone know of a place that a replacement knob can be purchased and/or is it possible to balance the stock knob?

Not to introduce heresy into this group (I do have a couple TS-850's) but Alex's comments has motivated me to ask.

Has anyone on this list put a TS-850 w/ DSP-100 up against a TS-950SD (not SDX)??

Comments? I'll probably cross post this Q to the TS-950 group also so if you also belong to that group, feel free to answer twice. J

Let's hear what you think.

Thanks es 73,

Chris

Hi, I recently repaired a damaged TS-850 CAR Board that was affected by the leaking caps plague. Now the rig works fine on SSB, CW and FM but in AM I have little or no reception at all. TX in AM mode is fine, but there is no RX.

Any idea of what might be wrong with this one?

Thank you in advance.

Shawn

Hi Rick. I'm sure no one would mind. In fact, I might surmise that most of us would love to have a TS-950SDX. I know I would. I agonized about it long enough where I'm worried that it could be supported if it broke. They aren't cheap on the used market. I loved my 850s, still have two of them, one is in operation next to my TS-590S. Also crazy about the TS-870S which is also connected and running. I'm not sure any of these older radios could beat the NR in the 590. It isn't a perfect radio but I can dig out weak CW sigs on it that I can't copy on the other radios. It would still be nice to have an SDX sitting here in front of me though. Tell us about yours?

12704. TS-850 No VOX or Break-in

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2014-05-11 22:23:17 UTC
From: w4zst@...
Topic: 12704 Message: 12704

I'm new to this list. I have searched the 'net for info on my problem and also searched in the archives some.
I have two 805's here.

One has a problem in that it won't do VOX or CW break-in (semi or full) but everything else is working OK.

It transmits both CW and phone by PTT with no problems.

I put in a new memory battery and also the -6V supply board, both of which it needed, but neither was the cause of the break-in problem.

I really expect that this is a pretty simple problem, but I haven't made much progress in troubleshooting.

Any help would be greatly appreciated.

Thanks, Bob W4ZST

Are you sure it's not settings? the VOX switch is also the CW break in switch. For VOX, is the level properly set on the back of the rig?
Example, I do not use VOX so I have the VOX level on the back of the rig turned all the way down so if the Break in/VOX switch is on, the radio will not transmit.

Hard to say without more information. Do the buttons beep when you press them? That would help to establish if this is a problem in the AF section or further up stream in the RF/IF sections.

Do you register anything on the S-Meter?

From: rogerio@...
Topic: 12715 Message: 12715

Dear friends,

My name is Rogerio Iguti, my callsign is PU2OYL (QRZ).

I have a TS-450S with a very strange problem, the power slower decreases during a contact, the power on 10 meters starts at 25w and slowly decreases for about 15w in 5 mimutes of talk.

The power at 40 meters starts at 80 watts and drops to 25 after 5 minutes.

This all using a phantom power(50 ohm) not an antenna.

When i tried to calibrate, i found some strange things:

The 60m BPF, the 3rd setting, asks for max 0,70vpp on my oscilloscope i can only get 0.2vpp.

The Antenna tunner does not work either.

Could please some one help me to troubleshoot my 450s?

Thank you.

Hi everyone I get E-mails and messages every cople months asking how to get the 450 to work with hrd.I have been a little negligent in responding to some of the and would like to say I'm sorry if I had not responded to your inquiry.

In my original post I did not say how to do it so I'll try to give you a run down on how to do it.

1st you need a level converter kenwood made one that you can use if you are able to find it and have a serial port on your computer. The easiest way is to buy a usb to serial converter cable off ebay built for the ts 450. It will have the usb connector on one end and a din plug on the other end.

2nd when you get the cable you will load the driver then plug the cable in and let the computer find it and set it.

3rd you need to go into the control panel in windows select device manager select comport for the driver for your cable and adjust the speed it should be 4800. leave the rest set at 8,n,1. make a note of the comport number.
4th bring up hrd use the drop down menu and select kenwood, then select ts 450. The perpetrators should be the com port that was in the device manager if not change it then verify 8,n,1 matches. after that there are 3 check boxes the first and last boxes should be checked uncheck the first one and hit connect with the radio on you should connect with in 2 seconds if not wait till it fails and go back and check the first box and leave the 3rd box checked. that should be all there is to it. if you still have problems send me an email or you can catch me on the air wed. nights at 8pm cst on 3.908 mhz for my tech. net out of Houston Texas.

P.S. this also has been verified by me to work with the 650 and 850 radios.

73's and good luck kf5jmj

Well, if it was an 850, I would say that either the master VCO has got problems.
In which case the first step would be to try and bring it back into adjustment. If that doesn't work, or the problem comes back, it would be time to replace the trimmer associated with it..

Topic: 12721 Message: 12721

Some years ago, I replaced the trimmer in the master VCO with a glass piston trimmer.

Set it up and all was well.

Ignored it ever since.

A little background, almost all of my operating is digital - RTTY on the contests and some JT65 when the contests are not running. Last weekend I decided to get a few Qs in the WPX CW contest.

Hummm raspy CW signals - maybe a T7 or 8

Open the rig up & get the VOM out - 4.5V on the test point. A slight adjustment. 5.04 volts - good enough for government work as we used to say.

So, I'm wondering what is causing the drift??

Problem is solved for now - but I guess that it's a warning to listen to some CW once in while, just to make sure that everything is still ok.

Didn't seem to cause any grief on JT65 or RTTY

I do not have info at coffee shop WIFI , but have used the Timewave unit .
I do not remember anything about there being an issue .
I tend to think your getting some confusion about using older amps that
have high voltage for keying , and that high voltage comes from the amp ?

Probably temperature change. I've noticed that mine drifts a little as I transmit and the innards warm up. I wouldn't think that a change from 5.0 to 4.5 volts would cause the raspy signals, though. When I had the raspy signals I measured the test point at 2.3 volts.

12727. Which leaky caps do I replace in the TS450S

Yahoo group: TS-850_450_690 (2010 — 2016)

Greetings all:

Before I start this repair, which electrolytics (in a general concensus) need to be replaced.
The IF Board part number, ie: C109 is what I need, to start looking up values.
Thanks for any advice.. 73 to all:

Andy - KU4XR

Hello Andy,

I have fixed several TS-450S with a lone leaky cap... BUT that lone cap had done LOTS of damage. We are talking about a 3 hour job to do it right: I get the IF UNIT out of the rig. Then I remove THE leaking cap, which is C104. And then it is usually needed to remove CF1, CF2, CN13 and sometimes even CF3, because the leakage gets into the bottom of the filters and it should be removed before damage extends. All the area should be carefully cleaned with alcohol. Then I look carefully to all the PCB vias on that area. If they seem bad or if in doubt, I scrap the traces at both sides and get a wire through the vias, soldering it at both PCB sides. Beware with the via just below the large heatsink, close to L12, which is easy to miss and uses to be damaged.

Be also very careful with C104 connections, as they may seem to be OK but can be damaged. If so, there is no audio on the speaker.

If you do a careful work, rig will work as new for years to come (at least regarding that area :-)!)

Regards,

JOSE

I replaced C104 and probably did a no no, I looked the board over very carefully and did not see any traces of leak damage. So I nipped the leads off the old C104 and soldered the new cap directly to them. I sticks up just a bit higher than previously from the factory, however, my hands are not as steady as they once were. So this worked for me. Do so at your own risk, but this was my fix.

Do be careful with alcohol - an IBM mainframe Customer Engineer educated me decades ago (I'm not saying how many decades :-)) - use 91% Isopropyl alcohol for cleaning electronics. You should be able to get it at a local drugstore. 99% Isopropyl contains benzene to get rid of the remaining water, and 70% contains camphor and other things and residues from either can be conductive. 91% contains 9% water, and both the alcohol and the water evaporate and leave nothing behind.

Do keep cleaning with fresh alcohol until everything is truly clean, you would be amazed how little crud it takes to mess up some boards.

As to the caps - replace any that show any signs of leaking. C104 is underated and almost certainly leaking - replace it with a capacitor with a higher voltage rating (25 volt or higher). Other caps can also have issues.

12733. My 850 lost ssb mode rx/tx, stuck in am on u/lsb rx and usb tx (carr. out!) , lsb tx ok??

Hi.

I just went to turn on my trusty, reliable TS-850s this morning and this is what I found:

1) I turned the unit on, put to 20m and tuned around;
2) Audio sounded like AM on USB & LSB RX (I tried to switch, just incase someone was using LSB there...) with all filter settngs (1.8k, 6k & 12k)
3) Out of curiosity, I put it on AM, and set both AM & the ssb filters to 6k to compare: exact same sound RX!
4) I tried to TX in USB: a carrier that didn't seem to be affected by attempt at modulation by voice into mic.
5) Tried LSB TX: seems ok, but both U&LSB RX is stuck in AM mode (or at least so it sounds...)
6) Put rig in AM mode & TX'd while listening on other RX: output is AM & signal seems ok.
7) Put rig in FM mode & TX'd while listening on other RX: output is FM & signal seems ok.
8) Put rig in USB & TX'd while listening on other RX: output is AM (not FM).
9) Put rig in LSB & TX'd while listening on other RX: output is LSB.

I don't have much to test with anymore, as I sold most of my test equip. to finance an HP8702 LCA I need for
work, (which once I get it here will do what the other stuff did & then some, but untill then,) any help and/or
suggestions to try to narrow down further are greatly appreciated!

Thanks, Rob, VA3GRU.

Rob,

One of the 3 850's I have get squirly now and then..and I have to do a system reset on the cpu.
Hopefully your Carr Board in not going...what serial number do you have.
If you can open and get to the Carr Board, you will see what's going on..hopefully no cap leakage.
The one I could not fix is listed as parts on an auction website. You can see the rough work I had redoing the
caps on the Carrboard, but I have gotten a lot better and have the SMD caps that are needed for another redo.
Once they leak...its a real pain.

Best of Luck,
Mike

From: rob@...
Topic: 12733 Message: 12735

Hi. Thanks for that info... Mine is a 60xxxxx serial no. (so no DDS chip issues) and the leaky caps on the CAR board were fixed long ago...

As an update: I turned it on again after letting it sit a while, and it worked all fb for about a half hour, then same thing again. Then, just out of curiosity, I put the rig in CW mode while it was still acting up and the rx of ssb is fine there, except for being off by the 500Hz tone shift...

This leads me to believe that issue is with the band switching mechanism. I will have to look into the board responsible and look for obvious issues like other caps that were missed (maybe other boards are subject to the leaky cap issue?...) not showing any signs of leakage at the time it was checked for this...

What is unusual is that the LSB seems ok. I went down to 3600MHz and tried, and it worked ok. Then I switched it into USB and same issue as on 20m: AM RX & TX, even with the carrier knob turned all the way down, which stumps me, as when I put it into AM, it does. This makes me wonder if the bandswitching mechanism is at issue at all: I would have assumed that if it's switching it into AM by mistake, it would work right? Also, the display reads correctly, saying USB when in USB and LSB when in LSB, etc., ... Maybe it's partially switching in or maybe there is some issue just past the logic that controls this...

In the meanwhile, I'll figure out which board / circuit is responsible for this and look around for obvious issues...

Thanks for your input! -73! Rob, VA3GRU.

12736. Re: [TS-850_450_690] My 850 lost ssb mode rx/tx, stuck in am on u/lsb rx and usb tx (carr. out!) , lsb tx ok??

From: Zack Widup
Topic: 12721 Message: 12738

My TS-850 slowly became more and more raspy again after I adjusted the VCO LO2 to 5.0 volts about a month ago. I did some measurements this time and it became raspy at 4.5 volts. At 4.0 volts the radio was almost unusable. At some voltage lower than that, I got the "UL" CW message. I didn't measure that voltage this time.

I adjusted the capacitor so the voltage at the test point was 5.17 volts and it seemed to work fine there. But I have a feeling it is not going to hold.

Does anyone have a recommendation for a replacement capacitor to use for the trimmer in this VCO circuit?

Topic: 12733 Message: 12739

Following a hunch, I have found that the cause is the humidity we've been having lately! My shack is in my basement, so this is exactly why it worked in the pm the other day, and wouldn't work during the humid morning / day, as when the moist outside air came in through the open window and ended up condensing inside. Taking a hair dryer to the open filter hatch fixes the issue (after a power off) repeatably. So, if anyone has this problem in the future and comes here for a potential cause & reads this, I suggest you go get your / your (x)yl's hair dryer, as this fixed mine right up...

I will also check & re-seat all the pcb screws to ensure that mediocre grounding is not part of the reason as well, as this was suggested to me by someone as well...

I now have a de-humidifier running 24/7 in the shack...

From: myyahoo@...
Topic: 12733 Message: 12740

If humidity is triggering the issue I would also look into board/circuit contamination. Humidity may be making some contaminant conductive. I would start by cleaning surfaces with 91% isopropyl alcohol. If that isn't enough, then start investigating contaminated parts (especially 'open' parts like trim caps) - and aging electrolytics that are being penetrated by humidity.

Being selective with the hot air might help isolate the area (or areas) of issue.

Intermittents like this are the bane of every tech's existence - but it feels oh, so good when you finally stomp them out!!!

Hi all,

I have a problem with my TS850, I can not completely suppress the carrier,
ie achieving the minimum, but this does not last long and gets back only.
Change VR8 and related VR9 and some capacitors, but the problem persists.
Greater than 60dB cancellation is achieved, but as soon as it reaches this
minimum, the carrier back up.
The setting is made ??according to the service manual and also using a
nearby receiver.
If anyone has the solution because it has happened appreciate assistance
with this.

regards
Alex.

You might want to check the IF board and look at c104 to make sure it is not leaking. I have the same radio and that cap leaked and i also had to run a jumper from the positive side of the cap to pin 4 on ic5. Need some more info and what you have tried. The IF board is under the bottom cover.

Good luck

Hello,

Last evening i powered up my TS-850S to make some QSO's. Unfortunately after listening some frequencies i discovered that my rig is not transmitting, RX is perfect on all bands, all modes, but i have no TX. It was 100% working few hours ago...
Also if i try to tune the antenna it will tune continuous untill some "beeps" are heard...I suppose it cannot tune because no output power is present. I tryed also on dummy load with same result.

Anyone else got this problem? What to check ?

Thanks in advance,
Daniel , YO6OHD

in that location is the potentiometer CAR? if you have not checked the power output you have ALC what marks the instrumentation on the red line? or how many beeps signal that you can listen to?

You might do a reset. Once in a while my TS-450 does that and I have to check the 'transmit inhibit' in the menu. Somehow it gets changed and turns the transmit off. 73

ok do some research on the internet, from the symptoms venture a hypothesis DDS chip on the CAR board,or a problem on the RF unit!I hope and I wish you an easy repair of the fault.

Hi group
When I switch bands I hear a short burst of audio and then it is gone...No audio any mode?
I have replaced IC5 Upc2002v.
I have replaced electrolytic caps RF board and IF unit board.
Any ideas?
Glen VA7CV
I have tested speaker jack and tested at the speaker pluig

12760. SSB Monitor Circuit Failed Today...

All,

I was working an EA station just now as my SSB monitor circuit became intermittent, and has seemingly to have failed completely.

Transmitted SSB modulation appears to be unaffected.

Any ideas? Thanks in advance.

Regards,
Steven Gehring

Yep, same problem..

Found out my kid turned the CAR knob all the way to zero...its gotta be at least at no. 6 or at one oclock...

also, my PWR was turned down....

When he pushed the wrong filters...I had no receive...

I have a locked cabinet now.

Try spinning the monitor volume knob & clicking the monitor on /off button
many times , while monitoring to see if there is a reaction .
older rigs often suffer from loss of connection in pots .

Update on audio trouble TS-450
The new IC5 UPC2002v is operating too warm? Hot to touch
All 5 solder connections seems good?
Maybe something in circuit loading it down?
I can restore audio jumping pin 4 to the speaker jack
The hot audio amp is shutting down?
Fun fun
de Glen VA7CV
Anyone have a very warm IC5 amp?

Is the "carrier" level up half way or so? If it's turned down, there's no output for the auto-tuner.

find on page 128-130 of the service manual kenwood ts-850, identify voltages, bias voltages of the BIAS of the final call txb check if it arrives or no power when transmitting. Follow the path starting from the form to get to the end plate 3080 x48-placed in the lower side of the apparatus on the left looking at the front panel. get to pistrina rtx x59-3680 service manual page 159. When the voltage of 8 volts TXB comes from a pnp transistor q152, q152 look at the board to see if it is burnt or unsoldered.
if it is blown replace it with a BC327 soldered directly on the pins of the ticket, sguendo order: the emitter and collector pin 7 to pin 5 and the base blend it with a small wire at the junction of 151 and 152 r (SMD)) side components.
finished txb the voltage on the collector of the new transistr begin to show signs of life, but if its value is instead of 8volt but less than 5 volts will have an overage protection that sends the controller card 7808 x46-d / 4 of line 8 A.

When the voltage of 8 volts TXB comes from a pnp transistor q152, q152 look at the board to see if it is burnt or unsoldered.
if it is blown replace it with a BC327 soldered directly on the pins of the ticket, sguendo order: the emitter and collector pin 7 to pin 5 and the base blend it with a small wire at the junction of 151 and 152 r (SMD)) side components.
finished txb the voltage on the collector of the new transistr begin to show signs of life, but if its value is instead of 8volt but less than 5 volts will have an overage protection that sends the controller card 7808 x46-d / 4 of line 8 A.

Anybody seen this one before?

S-Meter signal OK at pin 17 CN 4 on digital unit in all modes. There must be another logic signal coming from somewhere else that is turning off the S-Meter display for all modes but FM.

Weird -- Feels like a firmware bug or EPROM lost a bit somewhere.

Hello, I had a similar problem with my TS850, the smeter not work in any way.
The problem was a 0.01uF capacitor that is not in the schematic diagram, and as decoupling is one of the ACC2 connector pin 6 on the IF unit. In the schematic the wire as mark with "SM" line.
Remove it and the problem disappeared.

I hope the data will help.

12776. New member and WTB YK-88S-1 Filter

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2014-08-15 00:05:47 UTC
From: twilliam@...
Topic: 12776 Message: 12776

Hello Group,
Thank you for having me. I am an Extra Class ham in Southern Ohio licensed about 25 years and have owned and operated a TS-450SAT for about 20 years. I have other radios now but I always go back to my first love and have it on most every night. I have used it on most modes and use a SignaLink for the digital modes.
When I bought it new, that was a tremendous amount of money to me and I longed for some of the accessories but could not afford them. Now that it is an "old" radio I have picked up a few things on eBay, such as both 500Hz CW filters.
I have been watching for an SSB filter (the YK-88S-1) but have only seen the narrow 1.8 kHz version and I don't like the tinny sound of those. Anyone have a lead on a 2.4 kHz filter or have one for sale?
I look forward to being a part of this list. Thanks again for letting me join up.
73,
Tony KB8MVP

Thanks, AJ. I should have noted that the TS-450S takes the plugin version of the YK-88S-1 (The filter module is mounted on a small circuit board) while the ones currently listed on eBay are the solder-in types for the TS-830, 440 and others. I have watched eBay for a long time and have not seen any of the TS-450 type listed.
A couple of responders off-list suggested the Inrad 2.1 kHz filter as better than the original Kenwood filter. I will likely buy one of those as they are still available.
Thanks for all of the help.
73,
Tony KB8MVP

I just acquired a very nice TS-870 and will be selling my TS-850S station 1995 model year in near mint condition. My question to the forum is this: I have the radio completely loaded - 3 filters, VS-2 and DRU-2. I will be selling the radio with the MC-60 mic and SP-31 speaker. The whole station if sold individually is worth over $1,400. Should I sell it as a package for $1,200 or sell all the components individually. I am having a hard time deciding how to sell the equipment as a package or separately. Thanks.Glenn - K4ZOT

Topic: 12776 Message: 12782

Tony,

The filters w/ the -1 suffix ARE the plug-in versions. The filters w/o the -1 suffix are solder-in. Also, the YK-88S-1 filter is what comes with the TS-450S (and many other Kenwood HF rigs). You shouldn't need another unless yours is missing or defective.

And, instead of the OEM part, you might consider what InRad has to offer. They tend to have steeper skirts (better selectivity) than what Kenwood offers. They're of course more expensive but, it's a one-time expense. At $200 each, I've purchased their roofing filter for my TWO TS850S rigs, and would do it again. Eventually, I want to switch the other IF filters as well.

Tony,

This is what I have done with my Kenwood ts 850...Since you are looking for a filter.

I have bought a 'cheap' Trio or Kenwood yk-88s and 88 sn which is of course soldier in used for various rigs like the

kenwood ts 430.

I have then bought someones plugin...again 'cheap' Kenwood cw filter like the yk-88c-1

I have then removed the cw filter from the board...ez two ground points and four lead points.

And then swapped them and installed the yk 88sn (1.8 KHz) onto the board...and thus placed it after solder into the 850.

Enclosed is a pic of my rig with a SN solder in filter on a swapped board...

Let me know how your hunt goes.

Hi Bryan,
I thought that the -1 meant plug-in filters but some of the ones for sale on eBay are marked YK-88S-1 but are solder-in. Perhaps at some point they were desoldered from the carrier boards.
It looks unanimous that the Inrad filters are the way to go. I can get a 2.1 kHz which is narrower yet not so narrow as to sound tinny.
I'm sure you love your 850s - excellent rigs and the roofing filters are a great addition.
Thanks and 73,
Tony KB8MVP

HI AJ,
For many years I used an Astron RS-50M and it has been great but it is very large and heavy. This year I tried a small MFJ switching supply, the 4230MVP. It is tiny and has Power Pole connectors. It was been great for me. When I key down at full power with my TS-450S it draws 17 Amps. You want a supply rated at least that much continuous. The MFJ is rated 25A continuous. So far, I love the little MFJ - I have not picked up any RF interference from it, which is always a risk with switching supplies.

Mike,
That is a great, creative idea. If I can get the SSB filter in solder-in plus a cheap CW filter in plug-in I can swap modules and have the plug-in SSB filter.
Hams are always thinking outside of the box.
Back to eBay to do more shopping.

Depends on how much money you need and how much trouble you want to go
to parting out the set-up. You will obviously make more money parting
it out. I also think it would be easier to sell that way.

Best way to decide is based on how much effort you want to put into selling it.

First thing I'd do is check the SOLD prices for your stuff on eBay. You'll quick gain a range of values folks are willing to spend. Do the same thing with the individual components you can (or are willing to remove).

Once you've done all the math and pick a price for which you're willing to sell, deduct approximately 16% for the selling cost on eBay/PayPal. Then put it up for sale on this reflector and other non-fee sites. You'll now have a very realistic basis as to whether to accept a given offer.or not. Good luck.

73,

Chris

From: kd7gti@...
Topic: 12791 Message: 12791

I am trying to set up my TS-850 for fsk using MMTTY and N1MM. It has a pair of Inrad 400hz filters. Problem is the Mark and Space tones aren't centered in the passband - in fact if I center them using MMTTY, they are about 100hz off of the TX freq. Slope Tune doesn't help and can't find any other adjustments to move the TX to align with RX when centered in the passband. Is this an alignment issue with my rig or do the filters have a problem? I looked back
in the archives of one of the groups and someone suggested this might be the case but that's

where the thread stopped.

Thanks,
73, Doug - N7NM

Hi Doug

I ran into much of the same issues when I loaded up my ts850 with inrad filters as well

2x2.1 2x270 and a 250hz

One of the problems is that the slope tuning range for each filter is based upon what Kenwood expects to see in that particular slot!

What I usually do on RTTY (I work as many RTTY contests as I can find time for) is use the 2.1 khz with slope tuning...

Remember - the slope tuning is based upon what Kenwood expects to be in each filter slot, so insert the crystals accordingly

12796. For Sale: Exc. Cond TS-850S - serial #70M

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2014-09-01 03:33:46 UTC
From: packardg@...
Topic: 12796 Message: 12796

For Sale: An excellent condition and operating Kenwood TS-850S 100 watt 160-10M transceiver with built-in auto antenna tuner. This is a difficult to find last production run of the TS-850S – serial number #70M with the “newer DDS chips”. Overall condition is a 9.5+/10. Included is the original manual, hand microphone, YK-88S-1 SSB filter, power cord and original Kenwood shipping box with foam inserts. I am selling the radio because I found a great deal on an end of production run TS-870S and can not afford to keep both radios. Price: $750 + shipping. Prefer PayPal or USPS MO. Radio will be double boxed, securely packaged and insured.

Extras – sold individually or can be sold as a complete package – see below.

MC-60A mic – VGC with manual: $75.
SP-31 matching TS-850S Speaker with three filers – EC: $90.
DRU-2 Digital Recording Unit (voice & CW) - $90.
VS-2 Voice Synthesizer Unit - $75.
YG-455C-1 500 Hz CW filter - $90.
YK-88SN-1 1.8 KHz SSB Filter - $90.
Original Kenwood TS-850 Sales Brochure (color – 8 pages) – EC $20.
Original Kenwood 1995 General Radio Catalog (color – 8 pages) – EC $15.

Complete package is $1,100 (includes all items above – nearly $200 savings). Package will only be broken up after this post is posted for three days. I would prefer to sell as a complete package especially the filters which really boost the performance of this radio. Also, the DRU-2 recording unit is a very nice addition to the radio especially when contesting. The VS-2 Voice Synthesizer is also a great addition for any Hams with eyesight issues. To find all of these extras in one TS-850S is very rare these days. All of the extras installed makes it a very fine radio.

Thanks,

Glenn – K4ZOT

12798. Wiring Harness/Coax Jumper Connections

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2014-09-01 16:22:37 UTC
From: k0lsr@...
Topic: 12798 Message: 12798

I bought a TS-850 from a ham who had removed most of the components to replace the wiring harness. Does anyone know of any source that shows or describes exactly which points each coax jumper connects? I have gotten some information from photos online but there must have been some set of instructions for us during construction at Kenwood. Any help will be appreciated.

12799. Re: [TS-850_450_690] TS-850 display

From: Zack Widup
Topic: 7493 Message: 12799

Actually, no; it is extremely easy.

All the cables to the front panel are at the bottom. So I removed the top two screws for the front panel, loosened the two lower ones a bit and pivoted the front panel downward to a right angle with the chassis. The display board is right there. Remove five screws and one ribbon cable and it's out. It couldn't get any easier.

From: n9bx73@...
Topic: 12800 Message: 12800

This may seem far fetched but I would like to trade a Great working TS-450S around a 9/10 Very small scratches on top, you would need magnifier to see them for a TS-690S. But maybe someone wants this radio without six meters.

UPDATE

Looks like one of DDS chips was damaged.
My luck was that i found fully working DDS boards with new DDS chips YM66312 on ebay :)
Lucky that i found it, unfortunately that took out 280 usd from my pocket.

My TS850 is working now since 2 days :)

12804. Auto tuner for TS-440 and TS-450 are they the same?

I know you had asked for a " list" of the problematic caps on the 850 but I don't have or know of one. It is MY opinion that the BEST answer though, is to replace ALL of them! However, the most problematic caps, seem to be the caps (again, all of them) on the CAR board......as well as the digital display board. Hope this helps a little as you seem to be quite anxious. Good luck!

If you are going to replace capacitors, replace them all. The radio has enough age that i would think that full replacement is the best option. If you don't want to go through the trouble of determining all the values needed and take the time to source them, on eBay, you can buy SMD cap kits for the carrier board and you can buy a complete package of 113 electrolytic capacitors that cover everything else except the power supply. Since almost all the caps are sold in packages and require no work on your part, i would probably also take the time to look at the schematics and replace the caps in the power supply.

Capacitors will change value with age. They may not necessarily be bad, but if enough of them go out of spec, even a little, the cumulative effect can cause problems. Even simply changing some of them in a circuit can be problematic. Since all the caps have probably aged at very close to the same rate, replacing some of them can restore part of the circuit and further stress the remaining out of spec caps.

I wish you luck on your journey. Make sure you have the proper tools and skill set to work with multilayer boards and SMD components. Also, do not be tempted to use lead free solder for the rework. The mixing of lead free and leaded solder, even if there is just a tiny bit left on the solder pads, can cause problems. Lead free solder is not eutectic and when mixed with lead alloy solder, which is eutectic, the resulting mixture could suffer microscopic cracking, causing a poor solder joint.

Good Morning Alex,

The stock auto tuner units for the TS-440 and TS-450 are not interchangeable. Unfortunately, I can't think of any models that share the same tuner unit except of course for the 450/690 series. I wish you good luck in finding a good unit for your TS-450.

The radios that were earlier up to about 5-6 million serial number had counterfeit electrolytic [the aluminum cans] both through hole & surface mount] .
Then after that , any electrolytic caps that get to 20 yrs. or older .
If not the aluminum cans - electrolytic , then leave in place .

I copied this from a post I made a few months back. Maybe it will help:

“I have two TS-850SATs here, one in the 30 mil s/n range and the other in the 50 mil range.

The 50 mil one has never had to have any capacitors replaced but I have had to replace several on the 30 mil one. On the 30 mil one, I have had to replace all of the electrolytics
on the carrier board (9 of the 11 were leaking, but no damage to the board).

I replaced all three electrolytics (C7, C8, and C18) on the display board after finding what
appeared to be a slight bit of leakage around the (+) lead of C18. The slight discoloration may have been from something else but decided to replace all them while I was in there.

C187 on the IF board (audio section) failed (bad odor and rumble in audio) so I replaced all
four caps associated with that stage while I was in there (C187, C167, C182, and C184).”

Topic: 12805 Message: 12817

I replaced all the electrolytics on the carrier board of my TS-850 a couple months ago. I think I used the SMD electrolytics which were rated at the next higher voltage. These are the Mouser part numbers: 647-UUD1E100MCL (10 uF) and 647-UUD1E470MCL (4.7 uF). I think 6 of the 10 uF caps were leaking on my unit but no damage to board patterns.

A few weeks ago my display started flickering and sometimes going out altogether, so a week ago I replaced C18, the 470 uF cap, on the display board. I did have to put on a couple jumpers, as the solder connections for the caps were corroded by the leaking. I did not replace the other two electrolytics (C7 and C8) because they weren't leaking and I didn't have replacements at the time. The display works fine now. It is so easy to get to that I figured if there are any problems with the other two caps I can replace them in an hour.

Hi Mike,

I'm not sure what you mean. Do you have a YK-88s1 filter or the plug in board itself?

Thanks
Alex

Alex, try checking w International Radio, but make sure they can tell you
if the hole pattern on their board is the same as Kenwood's.

From: Bryan Swadener
Topic: 12821 Message: 12825

The thing is, the OEM Kenwood filters aren't all that great.
Better to buy an InRad #88 filter and be done with it.
Compare the specifications:

Mfr: KenwoodMfr PN: YK88S-1
BW @ -6dB: 2.4KHz
BS @ -60dB: 4.4KHz
Shape Factor: 1.833:1

Mfr: InRad
Mfr PN: 88
BW @ -6dB: 2.8KHz
BW @ -60dB: 4.2KHz
Shape Factor: 1.5:1

You can see that the InRad filter has steeper skirts. While it is a
tad wider at -6dB, it is narrower at -60dB, You'll have less adjacent
channel interference (aka "bleedover"). I can't believe I wrote that
last word. Yes, at $130, it costs more. ONE TIME.

I've been collecting InRad filters for both of my TS850S rigs. So far,
I've purchased two new roofing filters and a couple of used CW filters
to replace the Kenwood stuff. Compared to Kenwood filters, used
InRad filters don't come available very often. There's a reason for that.

If you call InRad, requesting one of their boards to install a Kenwood
filter, don't be surprised you get the above... at best.

Hello to the Group!
I've just purchased a Kenwood TS-850SAT to take the load off my little Yaesu FT-857D.
So far, I LOVE this radio! It pairs very well with my mini-G5RV antenna.
One issue I have is with the authors of the manual! Some real "holes" in this document!
Here's two questions I have....so far....
1. The spec.'s say the receiver goes down to 100khz, yet I can tune my VFO down to 30khz???
2. I managed to figure out how to save frequencies, but am stumbling with their recall???
Thanks for allowing my to join and "pick" you collective brains....Michael, N3QIG

Hi Michael,

It's a great radio, isn't it?

I did the mod to remove the attenuation for the broadcast band. I have no problems with intermod or overload from local AM stations as a result. It isn't extremely sensitive below 100 kHz. I can receive WWVB on 60 KHz fairly well with mine.

As for the memories, there is a set of buttons to the right of the tuning knob for A, B and M VFO's. If you push the "M" RX button, it will select the set of memories. There are 99 memories. You can go through them by rotating the "M.CH/VFO CH." knob. You can select the memory you wish to store something in with this knob, then push the A RX button Tune in to the frequency you with to store and then push the "M.IN" button. It should store the frequency in that memory and you can go back to it with the "M" RX button and "M.CH/VFO CH." knob. After you have one or more memories stored, you can load them into the A or B VFO's by selecting that memory and pushing the "M>VFO" button.

I hope this helps, and have fun!

Thanks Zack! I'll try your suggestions!

Now I'm trying to get an IF-232C unit to work with the radio. I bought a converter cable to allow connecting to my computer via a USB port rather than a 232. Installed the cable driver, but HRD 6.2.3.... still won't recognize the radio, even if I use the auto-detect options.

One line of the error message suggests I assure the radio is not in "packet communication mode"....can't seem to find any reference to this anywhere.

Can't seem to get the IF-232C to talk to the radio....getting an error for the cable from the IF-232C to my computer. The IF-232C's communication port (RS-232?) had an adapter installed to accept a 9-pin DIN. I bought a 9-pin DIN to USB cable so I could connect with my computer. I installed the cable driver but still get a "This device cannot start. (Code10)" error.

The problem could be with the data transfer through this mess. Is there a modern, USB driven replacement for the IF-232C? I'd like to use the IF-232C, bt am at a loss for ideas.

Thanks! Mike, N3QIG

Do I assume you are using a proper, known good serial cable? Are you sure that it isn't a null modem cable or a specialty cable? I have a serial cable for connecting APC SmartUPS APCs to the computer but the pinout is apparently different because it wouldn't work with Ham Radio Deluxe, I had to dig out the real serial cable. The USB to serial adapter, does it have the PRolific or FTDI chipset? If it is the Prolific chipset, that is part of your problem. The Prolific chipset is kind of a fake driver chipset. Get the FTDI. Anything with the Prolific chipset is intermittent at best. I mistakenly bought a Prolific cable for my Baofeng HT and it does give me fits, though not enough to make me want to spend more money for a FTDI cable as i can make it work. What kind of computer are you using? Doesn't your computer have a serial port? If you have a desktop you can add a serial card. They aren't expensive. I added a card to my HP Z210 small form factor desktop, I just had to get a low profile card. I have my TS-850 connected through my IF-232 device and my TS-940 connected by a Piexx add on RS-232 board because it was available and much cheaper than an original IF-10 board. I hope I gave you food for thought. By the way, just make sure that you have your serial port programmed properly(4800, 8, none, 1, none) and, if you are using HRD, make sure that CTS and RTS are checked. Hope this helps out. I love my TS-850 and TS-940. I won't sell either of them.

12836. TS-450 tuner and bad TX relay?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2014-09-24 12:45:38 UTC
From: ok1vaw@...
Topic: 12836 Message: 12836

Hello,
I am using the TS-450 with internal tuner as a secondary radio by my parents. As far as I have used there a few ugly portable antennas, the tuner worked sometimes sure with greater SWR than 3. In the manual the SWR below 3 is given as a limit, but the ability of the Kenwood's tuner to tune most of impedances is commonly known, but I was not able to find, if this situation (when worse SWR is correctly tuned by the tuner) could damage the tuner by stressing too much the relay contacts by high voltage or high current than allowed.

I am experiencing now a situation, that I tune the antenna (even with a modest swr below 3) with tuner, but after trying to PPT with full power 100W it seems, that there is a intermittent contact on the TX path or even I here something from the radio, which I compare to sound of sparking or similar, sometimes it changes the TX state between good and fail erratically, but I can confirm, that the problem is not in antenna itself. In this situation the SWR meter goes high, the TX control put the power down, but the radio case itself is "RF HOT", I feeled the buring of the high frequency current in this situation, so it seems that the power does not reach the output connector.
Opened the radio, I have looked to the most mentioned problem with the bad contact of the output TX connector, but it seems to be okay there.
Could anybody inform me, if he meets with similar problem and probably what was the reason? I bought the main TX/RX relay from Digikey, but I suspect the relays in the tuner too, after years of work and thousands of cycles it could be weared.
Looking forward to any relevant info and thanks for reading,

ok1vaw, Vojtech, Prague.

Hi Vojtech,

Just a thought but you may have high Rf in the shack due to the temporary antenna you are using. The Rf will cause sparking and erratic behavior of the rig. I had a similar situation with a Buddistick antenna I was using, and it caused my CW keyer to give extra dots plus I could feel it on my fingers when keying.

To cure the Rf in the shack either change to an antenna like a dipole or insert an Rf choke into the transmission line after the radio.

Hope this idea helps.

OK, I've bought a Kenwood TS-850SAT and wish to set it up for PSK/RTTY/ etc.

I have the SignaLink USB (with Kenwood appropriate cable and Plug & Play Module) hooked up and a CAT cable connected to my PC. I'm running HRD/DM-780, and am decoding just fine, but can't seem to contact anyone. The antenna SWR is way down, the radio's mode is set for FSK, and the SignaLink TX is set about halfway.

I'd worked digital for about 3 years using my Yaesu FT-857D, the SignaLink (with Yaesu appropriate cable and Plug & Play Module), CAT cable, and DM-780 with no problems.

Any thoughts? Thanks in advance! Mike, N3QIG

Topic: 12839 Message: 12841

I tried that initially but there was no output; like keying the mic without saying anything on SSB.

Bruce,

I spoke too soon! Once I set my "mic" as being the SignaLink, I was able to use USB and made my first digital contact with the TS-850S!

Thanks! Mike, N3QIG

I've had a 450 for some years now, working good a little display problem. I bought a 690 for parts that had a vco problem. I found the board on ebay cheap and I bought it. For my surprise the radio came out working pretty good. Came out with the same display problem, sideways looks perfect. Af goes up to 40 when you turn it on, in 10 min. Goes down. Believe leaking cap. And audio is a little low. Any hints where I should start looking. Thanks ahead.

Mike,

I use a Yamaha CM-500 headset, W2ENY mic adaptor, and homebrew
hand-held PTT switch with my TS-850. Foot switches are available
from MFJ, Heil, etc.

HI Mike

I am hard of hearing and wear hearing aids. I got a set of Radio Shack cordless headphones some time back and I really like them. They have a volume control that lets me set them at a comfortable level with my 'aids out. With most other 'phones, I had problems with squealing and not being able to adjust them right with the 'aids in. Also, not having a cord is a real plus!!

I also have a Heil headphone/mic combo that I used to use. I took the boom mic off the 'phones and put some velcro on the piece that used to connect to the Heil headphones and a piece of velcro on the headphones. Now when I do a SSB contest, I just connect the mic and go. It works very well.

For a foot switch, an economical (say cheap) way to go is pick up an old foot pedal from a sewing machine repair shop (they usually just throw them away) and put a switch in it. I have 2 of them here that I've used for many moons. The ones I have are made of metal and are very robust. 73

You can use the headset heil sound made in the usa with a footswitch, you can even put two microphone capsules that more 'close to the right, and the more' wide for normal QSO, I currently have a system with heil sound model pro-Plus Set with pedal and switch, if you have an amp you have to pass the switch on the amplifier .Avoid are fond of microphones studio audio, you should use headphones and microphones for amateur radio amateur radio, however, if you keep the impedance of the microphone from 50k-a 500 ohm ts 850 will have a good audio response, provided that the setting of alc and the compressor is not very thorough, you can also adapt some surplus military cap, are at a lowest cost, the pedal switch you have to lug on the socket microphone bypass it first with a plug rCA connector before 8 din kenwood microphone jack, picking up the pin ptt-standby, I repeat if you want heil sound has all the kit headset and foot switch

I am thinking about buying aTS-850 and I want to use it on 160, 75 & 40 AM as well as SSB.

Will it produce a decent AM signal?

Are any mods required to get it to sound good on AM?

Do I need to add an AM filter?

I'll be running it with an Amp Supply LK450 (single 3-500) & would like to get about 200 watts out on AM.

Any experience out there?

Hi,

On receive the AM sounds quite toppy on the internal speaker, but there is a tone control to smooth the edges off. The filters in the rig as standard are not bad, select 6k at the 1st IF, and 6k at the second, and you will be ok.

I bought the Kenwood 8.83/1st IF 6k wide am filter, it's better than the standard one but I find that I never use it. In fact I often run the first IF straight through just relying on the 6k in the second, I just like the sound! For hifi AM you can use the 12k standard filter at the second IF which sounds good on strong signals.

On tx output is 25W max carrier. Be aware that the mod is low level and if you overdrive the carrier, the mod can sound SSB like. If you have some external processing then AM on the 850 sounds great. (There's no internal processor built in on AM). The hi boost that you can select on the front panel makes the AM signal very intelligible. There is also a secret menu that allows you to select a 12Khz wide TX bandwidth, instead of the standard 6k, which allows you transmit very nice quality AM, if band conditions allow!

Overall a great rig, only let down by the lack of processing on AM. If you can get the DSP100, AM is generated digitally and sounds so clean.

On SSB the transmitted audio is excellent, likewise on receive with v good agc with no horrible distortion on initial transients.

Here is a website that focuses on quality audio from the 850:

http://www.ka0ka.com/index.html

12854. For Sale: 448-3090-xx If Board - Plus long story behind why I am selling it

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2014-10-08 20:29:07 UTC
From: Bob Bruno - K2KI
Topic: 12854 Message: 12854

Hi all,
I have for sale a X48-3090-xx If board for both the 450 and 690.
I am asking $100.00 plus shipping from Vermont 05459.

Please allow me to regale you a story behind my needing to sell this.

As some of you might recall, I was looking for a new IF board that had the dreaded capacitor leak problem for my TS-690.
I barked and barked on the list but no one had one.

The leak destroyed many of the traces that selects which filter on board will be active plus an audio line and a couple more I didn't bother to find out what the were. I scrubbed the board thoroughly and removed the soldered in filters to clean them plus the board beneath them. I also did a point to point wiring with #30 Kynar wire to repair the eaten traces Hot gluing the wires into place.

After all this, I took the narrow CW filter from my trusty TS-940 and installed it in the 690. After doing this, I found the the filter would not select. I went into the hidden menu and made sure to reset the radio and to also make sure that the filter was installed.
Still no joy. The rest of the filters would activate but the 250Hz filter would act as though it was dead. no sound at all.

I then went over the entire filter select lines plus input and output lines. The filter select lines were working.
I then decided to look for another IF board that did not have the cap leak problem. I finally found one on EPAY and bought it for $125.00 plus $13.00 and change to have it shipped to me. When it came, I gave the caps a good looking at. They were replaced with a 50V variety.

I put the board in, reset the radio, installed the 250Hz Filter and made sure it was selected in menu. This was going to work... RIGHT?
WRONG!!! I still had the same problem. UGGH (Here is where I start pulling my hair out and jumping up and down while spouted words that no person should even hear). What was going on?????

I scratched my head and left the radio alone for a couple of days. A few days later I had an idea. I knew that the 250Hz filter worked in the 940 so that couldn't be the problem RIGHT?

WRONG!!!!!

I noticed that inserting or removing the filter from the 940 required almost brute force to remove it and upon inserting the filter, I needed to insert one side whilst pushing on the connector pins on the other

side with a small plastic tool to get the pins to align with the holes and this would allow the filter to become seated.

After doing this, I had an Epiphany... What if it was something wrong with the filter itself? I broke out my trusty head magnifier, soldering station and my trusty Cubic Zirconium encrusted tweezers and examined the 250 Hz filter board thoroughly. Guess what... There was a hairline crack where the solder connection for the connector meets the trace on the filter board. This is the line that activates the filter.

Since the filter was firmly connected to the 940, I came to the conclusion that the pressure put on the contacts caused the offending contact to be pushed together with the trace causing the connection to make a more solid connection to the solder connection. (note that the filter plugs easily into the 680's IF board)

Once I repaired that connection plus re soldering the others, the 690 was back in business. I feel sort of proud that I not only repaired a board that was a total mess but I did what I would consider a professional repair job on the 690 IF board and was able to troubleshoot the problem with the filter.

I tested the new IF board I bought and it worked flawlessly. I plan on using the one I repaired instead of the new one. Just so I can say, I fixed it and it works!
Now, I have a good IF board that I no longer need.

So, that's my story. I hope it may help someone in the future who is experiencing the same problem.
If you wish to contact me with regards to buying the board I have for sale, then drop me a line offlist.

Thanks for reading this!

Hallo to the group,
I recently got an " used, but quite unused" (hi) TS850 at a very nice as and I want to join it the "old" TS930.
I'm an only W OM, as SSB is for some friend in my area and not more, and placed the two CW narrow filters in the 850 and so I now have an SSB narrow YK-88N-1 1,8 kHz filter that I don't use anymore.

I think a good price could be 60 euro + shipping. (I'm in Italy)
If anyone need it please be free to drop an email: i5skk.qrp(at)gmail.com

Best 73 and cu on the air.

The routine is as follows, 01 is the function that you need.

Pressing SCAN + TX-M.CH will set the radio into its extended function mode. These options can be scrolled via the M.CH/VFO CH. switch. The following are the extended functions:

00 - This is the ROM Checksum displayed as a 4-digit hexadecimal number This cannot be changed.

01 - Allow filter selection in transmit. Initially set OFF.

02 - Antenna tuner power down. Initially set to OFF.

03 - Antenna tuner non-stop mode. When set to on, the antenna tuner will not stop when the lowest VSWR is found. Initially set to OFF.

04 - Store mode, and filter settings prior to changing bands, or channels. Initially set to ON.

05 - Display -HELLO- on digitial display, and send it in Morse code on power up. Initially set OFF.

06 - Turn full LCD display ON on power on. Initially set OFF.

07 - Turn Subtone ON or OFF. Initiálly set ON. Note that even when set off, the TONE indicator will be lit on the display.

08 - Unknown. Initially set OFF.

Hello,

The TS-850S produces a terrific signal on AM. Here's how to do it.

1. Set the rig's RF Power (PWR) control fully clockwise for 100 Watts nominal power output (peak power on AM, which is equivalent to 100 Watts carrier power on CW).
2. Adjust your Mic Gain (MIC) for the setting that just produces a slight ALC reading on SSB.
3. Key the microphone on AM, and adjust the Carrier (CAR) for 20 to 25 Watts keyed and unmodulated RF carrier power output.

You're good to go now. Speak normally like you do on SSB. What you should see is this:
1. Similar ALC defection (keep in down and in the normal range)
2. RF Power meter deflecting upwards towards 50 Watts or so. Actual peak power should approach 100 Watts.

Good Luck. They really do sound good.

73.

Oh... forgot to mention:

You do NOT need an AM filter.
Set both IF filter section options to 6 KHz only.

And, use my previous directions, adjusting the carrier for 25 Watts (or
less) and the mic gain for full modulation, but well withing the ALC range.

Good Luck and 73.

Agreed, keep the mod peaks well away from the 100W limit of the rig or you will cause the alc to turn the carrier down, a common effect on a lot of rigs. The mod is generated in the balanced modulator which is unbalanced using the carrier control in AM. Overmodulating causes it to sound horrible. If you have ever heard a TS50 in AM you will know what I mean! The overmod does not break the carrier like the old plate and screen mod or like a series modulator, it folds over the zero point of the carrier as observed on a scope as you start to go into DSB mode.

2. Adjust your Mic Gain (MIC) for the setting that just produces a slight ALC reading on SSB.

3. Key the microphone on AM, and adjust the Carrier (CAR) for 20 to 25 Watts keyed and unmodulated RF carrier power output.

You're good to go now. Speak normally like you do on SSB. What you should see is this:
1. Similar ALC defection (keep in down and in the normal range)

2. RF Power meter deflecting upwards towards 50 Watts or so. Actual peak power should approach 100 Watts.

Good Luck. They really do sound good.

73.

On Wed, Oct 8, 2014 at 7:52 AM, cpa2000@... [TS-850_450_690]
<TS-850_450_690@yahoogroups.com> wrote:

I am thinking about buying aTS-850 and I want to use it on 160, 75 & 40 AM as well as SSB.

Will it produce a decent AM signal?

Are any mods required to get it to sound good on AM?

Do I need to add an AM filter?

I'll be running it with an Amp Supply LK450 (single 3-500) & would like to get about 200 watts out on AM.

Any experience out there?

This mod is OVERKILL!

Just use a good sounding mic with the rig. I personally use a Shure 522 with a response similar to a Heil Goldline. It directly drive the front panel's mic input jack and mic audio amplifier circuit, and sounds great on the air. I somewhat "close talk" the 522, lips within about an inch, and leave the audio tailoring "high-boost" circuit on all the time (most of my voice ops is on SSB).

Just follow my previous directions:
1. RF Power (PWR) control fully clockwise.
2.Carrier (CAR) adjusted for equal to or less than 25 Watts (unmodulated AM carrier).
3. Adjust microphone gain (MIC) for your normal SSB setting initially, then fine tune the mic gain for minimal ALC deflection.

If you follow these steps, you'll sound great! 20 to 25 Watts will drive most kilowatt output amplifiers beautifully also. I drive my Alpha 374A to a carrier level of 200 Watts. That equates to a rig carrier level of 20 Watts, adjusted with the CAR control (not the PWR control, leave that fully clockwise).

Hi folks,
I posted a forsale message for an x48-3090xx board. I typo-ed the
subject line.
Here are the details:

I have for sale a X48-3090-xx If board for both the 450 and 690.
I am asking $100.00 plus shipping from Vermont 05459.

Hi, It bypasses the mike preamp in the rig as I recall, so gets you the best audio out of the rig. Not something I think you absolutely have to do to sound good though.

By the way I bought the filter board for the 2nd/455kHz IF from INRAD. I fitted the board with a wire link and it's enabled in the 500Hz position. Not much difference to my ears on receive than when the 12kHz is enabled.

Hello Joel,

If you do not wish to use VOX, then you will have to manually push the SEND/REC button each time you wish to send. The VOX delay is on the bottom right side of the TS450, it will adjust the delay for send/receive. Fully anti-clockwise is almost like QSK.

Hallo guys I've a question if it was happened to someone esle here.
This morning I was working in the shack and listening the 7MHz band CW; it was raining but nothing more, when a sudden bolt made the main AC line off. I live in a little village outside the city and so it is normal; I shitched on and all was agin on tha web router, the freezer but.. tthe TS85o was mute at all. In TX it is ok, nothing different but in RX nothing at all, just in AM/FM I hear an hiss in the speaker but CW and SSB nothing. In andvance to make the search I'm asking if someone else experienced this trouble and in the case what was the foult; otherwise I'll do the serach beginning the AF line and going back. What I'm quite sure it's ok is the PLL as in TX nothing is wrong, but what's now I don't know...

Many thanks for ANY answer, help and suggestion.

Hello to all in the group once again! This week I received a Kent KT-1 straight key I ordered from one of the national stores. This is supposed to be a high quality key and it sure feels as such. It comes with a cable attached and you supply the plug.

OK, here is my concern (or most likely, paranoia). The TS-450 manual says on pp 11 and 22 to "always" use shielded line from the key to the transceiver. The cable that comes with the Kent is not shielded. Is this cable something I should change out for shielded (the manual is making me nervous here), or what would be the negative consequences of simply using the supplied cable?

Yeah, I am naive, but I would appreciate your input here as I don't want to do damage to the 450 (I am the original owner and have taken good care of the radio through the years).

Thanks in advance folks.

Hi Rick,

I use the shielded cable that you can get at Radio Shack from my key to the keyer and from the keyer to the TS-450. The reason I think the manual says that is to keep any stray Rf in the radio shack out of the keyer circuit. I also own a TS-440S and that manual also specifies using shielded cable from the key to the transceiver.

Hope that helps. Enjoy you new Kent key.

Scott, N6CIC

The radio won't know if the wire is shielded. It's probably recommended to prevent picking up RF in the shack etc.

If you want, I'll hook up my J-37 with some speaker wires to my 450 as a guinea pig.

Hans,

For the TS-850:

Positive 13.8 VDC goes to both Pin 1 and Pin 4.

Negative is Pin 2 and Pin 5.

On my factory cable, pins 3 and 6 are not connected. There
are not even any metal terminals in those positions.

Looking at the back of the radio:

```
Top

Topic: 12890 Message: 12890

So, my TS-450 just had the C-104 cap dump it's guts onto the IF board. Looking around, some people suggest that the C99 and C101 caps also can commonly fail in a similar way. I found the rating for the C104 cap, but I'm having trouble finding the ratings for the other two. I can't find it on the caps themselves. Does anyone know what these are?

I've also seen C20 suggested as something to replace. Is that a good idea?

I'm hoping that the elecrolytic goo didn't damage the traces enough that I'll have to add jumpers, but I guess we'll see.

Thanks
Sean KB1YOQ

Dear friends

I have a problema with mi ts-850
i have delay in rx after tx
the tx is good but when leave tx the rx return after 15 secs.. during this time not receive.
I have a caps in dds (car unit) with leakage. i change some caps .
maybe nb don work , and m-in buton dont Works too.
any ideas
thanks in advance
gus

Does anyone have any sources (Digikey, Mouser, etc) for any of the cables inside of the Kenwood rigs? Specifically I'm looking for a NEW source of ribbon cables, but part numbers for the little ?molex? connectors and RF connectors would be nice too.

I'm looking for new parts sources, not used surplus. If anyone can help, I'd greatly appreciate it.

From: Ervin Hegedüs
Topic: 12907 Message: 12907

Hi Folks,

I'm newbie here - my callsign is HA2OS, I'm a happy owner of a TS-850.

I'ld like to monitoring the band, what my receiver is "hearing", not just the audio output. I've an SDR (rtl-2838), and an LNB with 20MHz LO - now theoretically I can "hear" the 850's IF output.

But there isn't any signal at the output of SDR, when I connect the LNB to IF output.

If I connect the real antenna, I can hear the broadcast stations and markers on 40m band.
When I send signals from my rig, that also visible on the SDR, with a provisional antenna.

So, I think the LNB and SDR works as well.

On the Softrock SDR list, I got the info, here is this group, and may be somebody can help me.

So, what's the TS-850's IF output signal level? And what's the matched impedance?

Thanks,

Hi Ervin,
Since I didn't find the output level listed in any manual, I recall doing some deductive reasoning to approximate the wideband IF output level of the TS850. I found the sensitivity of my SM-220 -- if I recall correctly it is only a few mV/cm. And so, the maximum output level of the TS850 is very low... on the order of 20mV.
I wanted to drive my olde Heathkit SB-620 'Scanalyzer' (with the input amplifier switched to function as a mixer), and needed close to a volt across a few K-ohms to drive it. Since the TS850S' IF output is Lo-Z (likely 50 ohms), I was able to use four MAR-3 MMICs (about 10dB/unit) to get enough level to make it work. I hope that helps.

Ervin

I connected a "softrock" SDR reciever to the IF out of my TS-850 (now a TS-870), and you do need to amplify the IF out, though I only required one MAR MMIC.

It is not clear from your original question if you are fully aware of the output frequencies from the IF output socket.

It is the 8.83 MHz IF that is output, so your SDR center frequency needs to be on this frequency (you are monitoring the IF not the antenna signals).

The 8.83 MHz IF is after the 73.05 first IF, so it will have a limited band width of only a few tens of kHz, tailing off at the edges.

So to get the IF frequencies into your SDR you must first tune your SDR to 8.83MHz, then tune the TS-850 into the signals you want to monitor.

You will see quite a bit of spectrum either side of the signals, and you can tune your SDR around these signals, but no more than about 40 kHz.

regards

Peter

Hi Peter,

thanks for you answer,

my SDR isn't the Softrock (yet), now I'm using an RTL USB dongle
(RTL2838u). That works from 24MHz to up a few GHz...
That's the reason, cause I have an LNB, which mixes the IF signal upper to
20MHz. Then the SDR hears the IF signal as 28830kHz.

The 40kHz bandwith isn't problem - even, may be it's good :). In most
cases, the 40kHz is enough (usually I'm working on CW).

Anything else is clear, I'll see, what's the "MAR MMIC", and how can I get
one of that.

MMICs are internally matched 50 Ohm amplifiers, very simple to use. Mini Circuits and other vendors make them. Gain from 10 to 20 dB depending on model, power output 0 dBm to 20 dBm.

MAR is the series, like MAR-1, MAR-6 etc. Also ERA series, and MSA (from Avantek long ago).

You need a bias resistor, a decoupling capacitor and a DC blocking capacitor, and sometimes a small choke. 50 Ohm input and output.

Hi Dave,

thanks for the infos,

I've found MMIC closest to me, as I see, the MAR1 is enough for me.

I'll check this out,

73,
Ervin

All,

In looking at the TS850S schematics, the bandwidth available at the IF OUT jack is whatever is allowed by the lumped element (L-C) frontend bandpass filters. My panadapters (Kenwood SM220 and Heathkit SB620) and lab spectrum analyzer (Advantest R4131B) all show signals well over +/- 50 KHz. The only reason for sweeping a narrow span is the small size of the displays. A modern computer monitor screen has no such limitation.

The "Monolythic Microwave Integrated Circuits" (MMICs) I used was the MAR3 because I had them, and their low frequency limit was acceptable. Not all MMICs are capable of operation into the low MHz region. MMICs and other suitable amplifiers are available from various sources. Mini-Circuits is one source.

Because my SB620's input amplifier was necessarily switched to function as a mixer instead, gain was reduced, and I needed many tens of decibels of gain in order to see the low IF output (approximately 20mV) from my TS850S. Ervin may or may not need much gain (I was unable to determine his unit's sensitivity).

The TS850S has TWO IF chains. One passes thru the roofing filter and onward thru the rest of the receiver as normal. The second chain starts at a tap BEFORE the roofing filter, and mixes down to 8.83 MHz in a second 2nd mixer that Kenwood notes as the "Noise Blanker Mixer", and onward to the noise blanker. That wide bandwidth 8.83 MHz signal is one reason the noise blanker is so effective. Kenwood also provided that signal to the IF OUT jack on the rear panel.

As I mentioned off-list, one problem with a panadapter is the varying signal level, caused by the receiver AGC. It will pump up/down with signal(s) that make it thru the normal signal path to the AGC detector in the receiver. I had considered using a pair of Analog Devices AD603 VCA (Voltage Controlled Amplifier) ICs to invert the response. At around 9 MHz, each IC has about 40dB of gain control, using a DC source. In LTSPICE, I modeled two in cascade, and had 80dB control range. That type of IC may be more useful than a MMIC that has a fixed gain. Analog Devices' produces many variations and their website (www.analog.com) has a convenient parametric selector tool.

The LP-Pan system for the TS-850S can and will display a flat response over the entire 192Khz display. There are some residual "peaks and valleys" in the response, due to the effects of the 850 filter ckt immediately downstream of the IF tap, but they are still within a few dBs of 'normal' response on the display....

I had intended to experiment with the removal of these "peaks and valleys" by making the downstream filtering switchable via a small RF relay however I have not been able to get the time to attempt such an experiment...

Bryan,

many-many thanks for your precise answer again!

A few questions again:
- you wrote, that the signals are over +/- 50kHz - that means, the full bandwith is 100kHz? I think that's more than enough for me :)
- a simple MMIC (MAC3, as you wrote) will enough for me to drive the LNB? Which capacitors and resistors did you used?

My other thought - what is the impedance of the IF output of the rig?

A 50 ohm input may not be a good load if the IF output impedance is higher. Looking at the specs for the SM-230, The scope has a 1 megohm input impedance, but the input impedance of the IF input is not specified. I'd suggest testing the output before acquiring an MMIC. A good test is to put an oscilloscope on the output, then see if putting a 50 ohm load and watching the level. The output should drop by approximately half if the output impedance if 50 ohms.

If a 50 ohm load causes much more drop then you need a higher input impedance preamp than an MMIC provides, otherwise you could impact the rig.

Another indicator - if the rig goes quiet when connecting a 50 ohm load to the IF output - don't do it...

Subject: [TS-850_450_690] TS-450 Autotuner

Hi,

The local radio club (Pikes Peak Radio Amateur Association) has a TS-450 with autotuner that will not auto tune. It can be tuned manually. It will not tune on any band. I'm aware that it was designed not to tune on 160 meters. Anyone have any ideas or clues as to where to start troubleshooting?

Thanks and 73,

Jim H., W0EM

Topic: 12907 Message: 12919

In no particular order...
There are TWO 8.83 MHz signal paths. The first is the normal path (through the roofing filter) for the signal that exits the AF output. The bandwidth is narrow. We don't do anything with that. The other path (NOT through the roofing filter) passes through a "second 2nd mixer". Kenwood calls this the "Noise Blanker Mixer", and the bandwidth is limited by only the L-C bandpass filter on the frontend (hundreds of KHz wide).
According to the schematic of the RF Unit, Q15 (a dual gate MOSFET) is the "second 2nd mixer". The output from Q15 passes through transformer L64, C150, and L65 to CN7 jack. R117 (56 Ohms) provides terminates it. The wire harness connects CN7 to the IF OUT jack on the rear panel. That sure looks like (about) 50 ohms to me!
Going back to using my Heath SB-620 w/ Heath SB-102 and later SM-220, SB-620 and Advantest R4131B w/ Kenwood TS120S, TS130S and now TS-850S, it has always bothered me that the displayed level of signals outside the passband would go down/up as signals inside the passband went up/down. This is effect is caused by receiver AGC (or MGC) action.

The Analog Devices pn AD603 is a Variable Gain Amplifier (VGA), with gain adjustable using a DC control voltage. It has a 42dB adjustment range (+9 dB to +51 dB at 9 MHz). Using LTSpice, I simulated two cascaded AD603s for ~ 80dB adjustment range. The concept is to invert the rig's AGC voltage, and apply it to the VGA to stabilize the level when strong signals in the receiver passband decrease the receiver gain (and pip amplitude outside the passband). This is what an expander does. MMICs are not adjustable and have much greater un-needed bandwidth.

N8LP's LP-Pan would be a lot more attractive if it had a wider bandwidth and didn't take so much PC resources. Elecraft's standalone P3 at least uses its own hardware and can use an external display. I understand they're working on wider bandwidth.

Hi Tom,

Sorry to ask: did you hook up yr voltmeter to the SM test point of IF board and check the 0.6 Volt +/-0.01, and if not adjust it with VR5 as described in table of page 122?

73,
Jean-Luc - F4GEQ

12925. Re: [TS-850_450_690] Question about IF output

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2014-12-07 09:00:31 UTC
From: Bryan Swadener
Topic: 12907 Message: 12925

As I've described three times now, the impedance presented by the source to the IF OUT jack is approximately 50 ohms. All it takes is a look at the schematic of the RF Unit printed circuit board...
The output of the second 2nd Mixer (what Kenwood calls the Noise Blanker Mixer) passes through L64 (a step-down transformer), C150, and L65 (another step-down transformer). It then is connected to CN7 on the RF Unit, which has R117 (56 Ohms) connected across it. CN7 is connected to the IF OUT jack on the rear panel.
That would be the place to connect a AD603 or similar VCA (Voltage Controlled Amplifier), with inverted input from the rig's AGC to keep the average level constant. The input resistance is 100 ohms, shunted by 2 pF.
Even a MMIC would work, even though it has less gain and no way to control the gain. If you use fixed gain, you WILL see signals across the band appear to go up/down inverse to the level of signals that make it thru the IF chain and act on the AGC detector.

Hi Bryan,

yes, then I read it - but I've answered the last e-mail to Richard, and I
didn't realized your e-mail - sorry for that.

Well, I think now little bit cleaner, what need to do - I'll look at the
AD603 amplifier. There are several diagram on the internet - do you have a
prefered?

Many thanks again for your help,

From: myyahoo@...
Topic: 12907 Message: 12927

Since you're looking at using the RTL and a PC to do the display, you could also sample the AGC voltage via digital-to-analog converter and do the reverse-AGC in software, and use fixed amplification between the IF output and the RTL unit.

In either case you're going to need some test gear to align the setup. It depends on whether you are more comfortable/experienced with analog electronics or computer programming.

The problem now is when the rig is warm up.
No delay in rx when the rig is on recently , and receiver is ok but when the rig warm up begin the delay appears at more hot more delay and decreased the receiver signal , when i put the rig in tx the receiver is normal again and after few minutes come again lost sensitivity.
Any ideas
Thanks in advance
Gus

Gus, como andas?
Vichaste los 4066 que conmutan en el AGC y aledaños?, me paso algo asi con otro equipo, andaba bien un rato y luego empezaba a bajar sensibilidad incrementandose la lectura del AGC en el smeter, como si fuera disminuyendo el RFgain.
Resulto ser un 4066 lo cambie y fue santo remedio.

Saludos
Alex

Hola Alex

Voy a revisar.. el kilombo empezó con un mic en corto en la alimentación (8v) después empezó a prenderse la luz de tx mientas recibia,, me fije en la Car Unit.. y los capacitores estaban jodidos.. los cambie y el problema se fue , ahora cuando lo prendes anda barbaro des pues de un par de horas que empieza a calentar te empieza a retrasar la recepción y si lo dejas que caliente mas , te baja la recepción , le das al ptt y te vuelve a andar bien por un rato y después empieza a bajar de nuevo es como si los 8v que tiene que tener en recepción van cayendo..

Espero haberme explicado mas o menos..

El equipo estéticamente esta inmaculado pasa que no lo usaban hace tiempo.

12931. Slope Tune Hi-Cut Causing Freq Shift!

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2014-12-10 21:26:33 UTC
From: steven.gehring@...
Topic: 12931 Message: 12931

All,

After all these years, my TS-850's slope tune "high-cut" is shifting the transceive frequency right along with the high-cut. This is NOT good.

I haven't looked at the circuit, though has anyone run into this before? Does anyone have an idea what happened?

I was going to use the 850 for the 10M contest this weekend...

From: jim.w0em@...
Topic: 12904 Message: 12932

Hi,

I've not found why it does not tune in auto mode. As I said it tunes very well when tuning manually. I've followed the procedures exactly in the manual to autotune and it doesn't work. I'm guessing the detector diodes may need replacing. The reason for asking the question was hoping someone had encountered this before and could give me some hints as to how to repair it.

Does anyone have a schematic on the autotuner?

Any constructive comments would be appreciated.

73,

Jim H., W0EM

12933. Re: [TS-850_450_690] TS-450 Autotuner

From: N6EV - Paul Carreiro
Topic: 12904 Message: 12933

Jim,
To your knowledge, has the autotuner ever worked in this rig? If not, or your don't know, check that the jumper on the filter board has been properly cut during the process of installing the tuner. Ask me how I know! :)
Ok, I'll tell you anyway. :) I installed my autotuner shortly after purchasing my TS690 new. It never worked for me and I just got by with an external tuner. It wasn't until years later while I had the rig open tracking down another problem that I noticed the jumper had not been cut. As soon as I cut it, the tuner tuned properly. The jumper bypasses the tuner RF path, essentially shorting the input to the output of the tuner. You can see why the tuner would not have any affect in this case.

Anyway.. it's an outside shot.. but thought I would offer it up as a lesson learned.

Good luck

12934. TS-850 - best Inrad SSB filter configuration

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2014-12-12 05:16:45 UTC
From: darren.ream@...
Topic: 12934 Message: 12934

I am thinking of treating myself and my 850 to a new set of filters. I was thinking a pair of Inrads would be good for the casual operating I do, so I've settled on the 2800 Hz filter and the 2100 Hz filter. These will perform as the ragchew and DX filters. I will be transmitting through the filters as well. I have that feature enabled in the menu which gives me the flexibility to transmit through whichever filter combination I want.

The question is which way is the better configuration: the 2.1 in the 455 IF and the 2.8 in the 8.83 IF? Or the other way around?

One consideration is that I want to make sure I put the 2.8 filter in the side that removes the unwanted sideband. That way I can always have the 2.8 filter active and then cascade them for 2.1 DX ops. If either of the filters can remove the unwanted sideband, then I'll probably just go ahead and put the 2.1 in the 455. The 2.1 has a better shape factor in the 455 IF, maybe that's reason enough

Anybody have any experience with this?

Thanks,
Darren, AF7JD

12935. TS-450 Desensitivity Issue

Thanks in advance for your help.
Bought a TS-450 new in 1992 and ran it for 4 years ... no issues. It then spent 18 years in its box. Dropped it back in line last week. Signal reports are fantastic (all on 15 meters) ... it's hooked to an AL-811H. The issue is on receive. When unkeying the mic, receive audio is fine (volume) for a few seconds and then desenses like the attenuator is activated. I can still hear the audio but have to turn up the volume. A couple of clicks of the mic PTT may or may not cure the problem. Some QSOs are fine ... others are attenuated ... some require many PTT pushes. There's no real pattern.
Suggestions?

Hi

Are you sure it is a de-sense problem, or volume problem ? A very common problem in the TS-450 is a capacitor
that is almost guaranteed to start leaking after 10 years. Symptoms are the volume becomes weaker and weaker
over time. The liquid that leaks out, destroys the board if left too long.
Wether this is the problem or not, you must get those capacitors replaced, as they will likely have already started
leaking, and is a time bomb waiting to go off.

I've seen this problem a few times. Each time it was an antenna connection. Tapping the PTT brought the RX back up to normal. Sometimes the RX would slowly go down until the PTT was pressed again. Try a different antenna etc.This doesn't mean to ignore the CAP issue that John mentions below.Bob WE6C

Hi John

Take the top off and when this happens, wiggle the wire that goes from the coax jack to the board. Sometimes this comes loose and will give you the symptoms you describe. You need to re-solder the wire to the board. It happened to both my TS-450's.

It also might be the relay. 73

Happy Holidays!
Thanks for the help on the desensitivity issue. A number of people have mentioned a common issue with a leaky electrolytic capacitor. Is that something I can check myself? Where is it located? How do I get to it to give it a visual inspection? Once located and inspected, should the electrolytic capacitor need replacing ... is this something "the average ham" can handle or does the radio need to be shipped to a repair center. If this is something the average ham can tackle, what is the part number, specs, capacity, size, etc. of this capacitor? Are there other (easier) alternatives / substitutes? Sounds like an order to Mouser or Digi-Key.
Thanks, in advance, for your help.
Chris KochenourWD1W

Chris ,
I did a lot of research on which HF rig I wanted and then its faults &
fixes before I bought one [and then later a 2nd] .
The TS-850 was what I ended up with .
Some of the links that I found for this & other issues ,
http://usuaris.tinet.cat/vxjf/TS850.htm
http://jvgavila.com/wb7.htm
http://w0cp.com/tech%20tips.htm#TS-850
http://www.cqham.ru/ts850repair.htm
http://www.radiomods.co.nz/kenwood/kenwoodts850.html
http://www.ka0ka.com/rx_mods.html
http://oz1bxm.dk/TS850/ts850-repair.html
http://www.g4ifb.com/html/ts850_mod.html#ALC
Check all part numbers , spec.s agains service manual , because some I have
found have not all been correct numbers .
Many of these links refer to each other .
Wether you can manage the repairs , its not possible for me to say , I have
been doing all my own repairs .

The cap that leaked in mine was the DC blocking cap for the output of the Audio amp. when looking at the main board you could see the leaked stuff from it on the board and that caused all sorts of odd things to happen. I removed the cap, cleaned to board, installed a new one and have had no problems after that. If memory serves it was the largest cap on the board and was a different color than the others. I hope that helps.

Chris, am writing this from memory but I know for sure the cap is C104. It is a radial lead electrolytic cap on the top side of the board. If and when you replace I would suggest you use a cap with a higher working voltage than the original. I don't remember the original's working voltage. You have to disconnect several cable and remove several screws to get at the bottom of the board to unsolder C104. The next step is to slide the board toward the front of the radio so the connectors that protrude through the back will clear as you lift up on the board. I think you only have to disconnect the ribbon cables to the board but when you have the radio open you can see what has to be disconnected. In my radio the corrosive crud that spewed out of the bad cap eat its way through the trace of the AGC line. I would recommend you replace the cap as soon as you notice the audio level dropping off or just a preventive measure. This would prevent the repair I had to do with the AGC etch. C104 is in series with the speaker so as it goes bad the max audio level will go down to the point of no audio. I think the working voltage for the cap is low for the max voltage the cap can see.

The capacitor should be at least 25 volts, it is a 12-13 volt swing feeding an inductive load (the speaker) and the original is rated at either 10 or 15 volts (don't have the schematic in front of me).

It's no wonder that this cap pours its innards out, it is extremely underrated in this circuit.

I do not know abut the cold but one thing that would worry me is condensation. If you have a warm day the radio could end up with condensation on and in it if the dew point rises above the temperature of the radio. That could be possible if objects in the cellar do not warm up as quickly as the outside air. I have seen that happen in my garage so I do not leave tools out there in the winter.

I'd be concerned about condensation happening with the temperature changes, not just in the rig but in any gear allowed to go through big temperature swings. One trick is to leave a couple (old-fashioned incandescent) light bulbs turned on near the equipment to keep it a little warmer than the surroundings, it helps keep the rig dry.

Taking it in when not using it, though, would be the best protection. You might want to use the light bulbs for a single overnight, but bring it in when you're not going to use it for several days.

Thank you guys for calling that to my attention. So far I've been covering all the equipment with a towel when not in use. So far moisture hasn't been an issue however the WX is now just beginning to change so I'll be more aware of that. Until last week my coldest temps were high 30'sF but the last couple nights/mornings have been down to freezing with forecasts in the mid 20's this coming week.
Hopefully the shack will move into the spare bedroom this spring. This is a new QTH for me and moving isn't as easy as it was when I was 30!

12959. DSP-100 not activating

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2014-12-30 18:16:17 UTC
From: Jose V. Gavila
Topic: 12959 Message: 12959

Hi all,

I am working on a TS-850/DSP-100 set. What happens is that the TS-850 seems to miss the DSP-100 detection, as it does not switch on the IC12 switch on the IF UNIT (which routes the IF signals to the DSP-100 if present)

I wonder how the TS-850 detects that there is a DSP-100 connected, as that seems to be the problem. Any hint?

Thanks and Happy 2015!

JOSE

PS: the TS-850S is not at fault, as neither are the cables. Both have been checked with a working DSP-100

Hi all,

I answer myself ;-)... The first thing that the DSP-100 does when powered up is to send a CAT-like command to the TS-850 by means of the CONT IN connector PIN 2. You can see with an oscilloscope the data frame at L21 on the DSP-100. Each time you change RX or TX ON or OFF, a signal is sent. The TS-850 answers back by means of a DSP-3 connector line. I don't know exactly which signal uses but, if you disconnect that connector and power-up the DSP-100, you get a continuous query from the DSP-100, until you connect it.

Well, what happened on my faulty unit is that there was no data transmission at any moment from the DSP-100. As the CPU which manages that transmission is IC37, I have checked the obvious things: RESET signal, which was OK, and CLOCK... which was not :-)!. So I have taken out the XTAL (X2), have given it some light shocks on the workbench (as a way to dislodge any internal dust) and, once I have put it back on the unit, it worked!!!

So it seems X2 is (was?) faulty. Now the DSP works flawlessly. I will try to get a new XTAL (which, BTW, is a 9.216MHz one)

Well, now I know some more about how the DSP-100 works!

I hope this info helps other people to get their units going.

Best regards and Happy 2015!

JOSE

12963. Memory battery in the TS450?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-01-13 05:21:44 UTC
From: Phil
Topic: 12963 Message: 12963

Hi,
I got the beast today on a swap. Think I'm going to like it very much.
I did pull the top and bottom covers to examine it, and lit looks like
I'll need to replace C104 (from what I see in the group files that's a
common fault). Just the barest trace of a bit of corrosion under it.

Also, I think the memory battery will need to be replaced, the display
was 14.000 when I first turned it on. Where is the battery located? I
didn't see it under either the top or bottom cover.

I was lucky, this radio has the 1.8kHz SSB filter installed. As soon as
I get a chance I'll be putting 250Hz filters in both of the CW positions
as I'll probably want to use it to listen to NDB's (longwave beacons)
also. A quick check showed that it performs quite nicely in the
200-500kHz range.

The man I got it from said he also has the matching Desk mike that he'll
drop off next time he comes by, so that's good news.

Topic: 12964 Message: 12964

Hi All,

I posted the following to the NDB (Longwave beacon) list and thought I'd re-post it here.

After this I'll send an email to the group introducing myself and with some questions. I'd be especially interested in what anyone who has/had both an Icom IC-735 AND a TS-450SAT.

****
As you can see from my signature line, I have a number of radios Over the last 60 years I've bought, sold and swapped hundreds of them, some of them not staying in the shack very long. I do much less of that now as finances dictate that I pretty much stick with what I have, with an occasional purchase/swap of a "low end" radio. . .

Well, the IC-735 transceiver came to me a couple years or so ago through "sweat equity", that is, I worked for it, repairing some radios, antennas, and computers etc for Don, an 'older' (hey, I'm 71) ham buddy. When I first got my ticket in '94 the IC-735 was my "dream rig". It was at the end of it's run and featured in the ham magazines of the time. Don knew that and I think that he sort of did me a 'favor' in letting me have the rig with no 'cash' outlay, though I have certainly earned it otherwise (he's always having 'puter and/or radio problems). I don't mind as he's a good friend and I'd have done the work for him with NO payment anyway, and he gave me a nice Christmas card with a few pieces of green paper having pictures of dead presidents for Christmas (I'd just renovated his laptop).

ANYWAY, he's getting older and has been having a LOT of problems operating his present rig (Kenwood TS-450SAT). He can only see with one eye and has bad shaking in his hands. Fairly frequently I get a call that he must have pressed the wrong button and it isn't doing what he expects it to do. When that happens he just starts pushing buttons on it until it's way out in left field somewhere! In every case I make a quick trip to his house in Atwater (about 8 miles) and he's good to go again until the next time.

This morning I was having "coffee with the hams" at the mall (a weekly Saturday morning group). When I was getting ready to leave he cornered me and asked me if I'd be interested in swapping him my IC-735 for the TS450SAT. He thinks that he is starting to get the first stages of Alzheimer's and that the TS-450SAT is just too much radio to remember everything (most of his ham career has been strictly boat anchors). He asked me to think about it and let him know later this week, and I could bring the Kenwood home for a "trial run".

The only cash I have in the IC-735 is for the 500Hz CW filter I put in it, but I'd probably leave that filter in the rig as it's easier than taking it out. . .

NOW FOR MY QUESTION: There is no doubt that the TS-450SAT is a newer and nicer rig, than the IC-735 and is worth more value wise, even without extra filters. BUT I DON'T WANT TO TAKE ADVANTAGE OF A GOOD FRIEND! The primary use for the rig would be ham radio, NOT NDB's as I have better radios for those (the Icom R-75 & R-71A), and while they're reliable there are a few electrolytic caps that tend to spill their guts out in the 450. I'd want to replace those before that happened.

Date: 2015-01-12 04:25:26 UTC
From: Phil
Topic: 12965 Message: 12965

Hi all,
I'm new to this group, but NOT to radio. I've been swapping, buying, selling, using, repairing, tearing apart and home-brewing radios since I was about 10 Years old (around 1953 or so). Didn't get my ham license until 1994 as I let the Morse Code keep me from it that long (in '94 I DID pass the 13WPM test and got my Advanced Class ticket, never upgraded from that).

Now to the point of this email.

I 'may' swap an Icom IC-735 for a nice TS-450SAT. The FIRST thing I'll do with it if I do get it will be to put it on the bench and replace any leaking capacitors, battery etc as I doubt that the radio has been in a shop. At least not in many years.

Actually, my main DXing hobby is (and has been for a number of years) DXing NDB's, or longwave navigational beacons. I have well over 1200 of them heard, coast to coast, Alaska to South America, Asia and the South Pacific etc. Not bad considering most are designed for short range of 25-50 miles (there are some long range ones).

The TS-450SAT will be primarily used for Ham Radio (as it should be) as I have two very fine receivers for chasing NDB's, the Icom R-71 and especially the Icom R-75 which I've equipped with cascaded 250 & 125 Hz CW filters (in the NDB hobby, selectivity is EVERYTHING).

But all receivers in the shack sometimes get used "down in the basement", even the portables and the old Zenith Royal 7000 TransOceanic.

Now the TS-450SAT connection. In perusing the manual, brochures etc of the 450 it says that the rig tunes 500KCs to 30MCs. However, I noticed in the schematic that the front end filters of the receiver includes one that is labeled as ~0-.5 MCs (give or take). This would seem to indicate that the set DOES tune below .5MCs

If so, and if it's anything at all like the older TS-440, which was an EXCELLENT performer down in the basement, it would be a BIG benefit to me. Especially if I loaded narrow CW filters in both IF sections like I did the R-75.

What say, does it tune down there, and if so, does it perform well there (assuming you use a good LF antenna, which I do)?

12966. A few interesting problems with my TS-690S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-01-14 15:37:45 UTC
From: Bob Bruno - K2KI
Topic: 12966 Message: 12966

Good day folks,

I have a TS-690S which is exhibiting some strange faults.

1 - Occasionally the main encoder will stop working and when I go into the Extended Function 1 menu (LSB/USB + Power On), the main encoder is selected off. I turn it back on and maybe a day, maybe a couple of hours, the problem returns. This is a new problem that occurred last week.

2 - Occasionally the Up/Down buttons fail to work in normal operation but work OK in any of the adjustment menus and return to proper operation after exiting any of the menus with the CLR button. Same thing, new problem since last week.

3 - The display always show the M from FM and AM fully regardless what mode I am in. However, the F display does fully light when selecting the FM mode. Also new problem since last week.

Is there one common item that could be causing the above problems?

OK, this one is two part and complicated. I need to first tell you my filter setup. I have the following filters installed and they are selected in the Option Setting Menu (Ent/Power on), YK-88c-1 and YG-455CN-1. All CW and No SSB filters! (And yes, the 8.83 filter is in the proper location).

4 - Sideband issue: When the 8.83 filter setting is set to either Thru or 6K "and/or" the 455 filter setting is tuned to either 12K or 6K I can copy an SSB signal on either LSB or USB. So a LSB or USB signal is fully copyable just but hitting the LSB/USB button. No tuning required. HOWEVER, if I select 2.4K on the 455 side, all is well.

4A - CW issue: with the same parameters as above, I can copy a CW signal on either side of Zero Beat by using the main encoder knob. And as above, the problem is not present when I select 2.4K on the 455 side. When the problem occurs, the unwanted side of a CW signal is lower in strength but not by much though..

For problems 4 + 4A, This has been a problem for a while now. Since I do not use SSB very much and my 455 CW filter is usually on, I don't see the problem in CW.

I have tried replacing the IF board XS-3090-XX with a fully working board I had on hand. No joy to be found there. I have tried removing the filters in the Option Setting Menu then physically removed the filters and then verified that they are indeed not present in the Option Menu Setting after powering the radio back on. I also did a full reset (A/B +

Power on) and A=B + Power on). No joy at all!

I am at my wits end with this radio. This is my favorite radio to operate! Any help with these problems would be greatly appreciated! Thank you for reading this!

Hi Phil

The battery is on the digital unit - the board right behind the front panel. You have to remove that board to get to the battery.

I made an extension to reach from where the battery is on the board to a place where I could just tuck the battery away. That way when it needs to be changed again, the board doesn't have to be pulled out.

While you have the board out, you can also clip D27 and open the TS-450 to transmit on any frequency. That allows it to be used on 60 meters. 73 Tom W7WHY

Hi Phil,

I replaced both C104 and the Lithium memory battery when I got my TS-450S. The C104 replacement is a 470uf, 25 vdc radial capacitor and there are plenty on eBay.

I ordered the memory battery from Digikey, but I am on the road now and don’t have the Digikey part number. I hope someone else in the group can give you that information. It turns out the shipping costs more than the battery so I ordered two.

Good luck and enjoy you new rig!

Thank you Scott,
I replaced C104 a couple days ago (I had one on hand). Haven't done the battery yet. So far I'm very impressed with the radio, especially in the LF range where I spend a lot of time. Future plans call for adding a 250Hz Filter in the 8MHz slot and an Inrad 125Hz filter in the 455kHz slot.

12977. MC-60 Mic for the TS-450

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-01-19 00:45:37 UTC
From: Phil
Topic: 12977 Message: 12977

Hi All,
Today the Gentleman I got the TS-450SAT from dropped by and gave me a Kenwood MC-60 microphone & base. He asid he didn't have any need for it as it doesn't fit the Icom he got from me. Also said I might have to do some work on it as before he got it somebody left batteries in it and they corroded :(

Well, I was lucky, the corrosion was limited to the battery holder and one of the springs were corroded and laying in the base housing. So tomorrow I'll go down to RS and see if they have a suitable 2-AA battery holder. Though they have few radio parts now-a-days I'm sure they'll have something that will work.

The outside of the base looked a bit grungy from sitting unused, but cleaned up quite nicely, as did the handle of the microphone. I brushed the grills with a stiff toothbrush, but would like to clean it further.

Is there a way to get the head that contains the mesh grills off? I thought it might screw off like my Shure Vocal and instrument mics (SM-57 & SM-58) do, but so far no joy. . .

Also, I'm sure that the proper impedance setting for the TS-450 is Lo-Z (500 Ohms). But does the TS-450SAT 'like' the amplified or unamplified (under the stand) best? Yeah, I know, we hams are supposed to experiment :) I find that with the Kenwood Hand mic I don't need to turn the Mic gain up much above 9-10 O'Clock so it seems pretty "hot". On the Icom IC-735 that I swapped for the TS-450, mic gain with the Icom Hand Mic (electret) needed to be turned up nearly all the way to get optimum modulation.

The MC-50 mic head was glued on. I took a hair dryer & heated it up & was able to pull it off. You might try that on the MC-60.

From: Ken Winterling
Topic: 12977 Message: 12979

Phil,

To disassemble the MC-60 or MC-50 mic wrap the microphone in an old cotton shirt/cloth/towel to keep from burning your hands. Do not use any tools to grab the mic or you will damage it! Using a heat gun or hair dryer heat the joint between the head of the mic and the body and keep trying to unscrew (counter clockwise looking down on the mic head) the mic head. The mic head will unscrew after sufficient heat is applied. Again, do not use any tools to hold the mic!

Regarding the impedance setting, check the manual for the rig. The TS-450SAT uses a Lo-Z mic input. I have not used the mic preamp on any of the Kenwood rigs I owned or repaired. If you decide to use the preamp, depending on the particular version of the MC-60 you have, the batteries will not be required as the power will be supplied by pin 5 of the rig's mic connector.

You can't compare the Icom and Kenwood mic gain settings as they have different mic circuits. The older Icoms, especially, had very lower gain inputs compared to Kenwood or Yeasu.

Bob,
NDB is the abbreviation for "Non Directional Beacon", primarily navigation. Most are relatively low power, on the order of 25-100 Watts, usually into an (often short) Vertical or "Tee" antenna. In North America most fall in the range of 200-530kHz while some other areas of the world they are also in the MW broadcast band. I have somewhat over 1200 of them logged, coast to coast, Alaska to South America, Asia and the South Pacific. No easy task, believe me! Luckily most ID at a slow rate so very narrow audio and IF filters are usable with some ringing (I often find the filter ringing helps to reconstruct a beacon buried in noise). With the advent of GPS many are going "dark" as airports decide not to continue funding them. They are probably the cheapest "Navaid" to maintain, which explains why many are still in use.

As you're at the whim of ol' Sol (geomagnetic storms affect it greatly) along with T-storm noise in the summer, it is also a very addictive hobby, once hooked it seems like one always returns if they leave it for awhile. I've been at it for over 15 years, left for about a year and returned about 2 years ago. . .

Thank you Ken,
After much brushing with a dry, stiff toothbrush the grills cleaned up quite nicely. Nice enough that I'm not going to risk heating up the mic. I found a suitable 2xAA battery holder at RadioShack (it even has a cover that should keep any future leakage enclosed). I've got the mic base all back together now and it works well.

12992. TS-450SAT tuner/coax issue

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-01-24 16:39:29 UTC
From: rzacharkow@...
Topic: 12992 Message: 12992

Happy New Year to the group!
Want to present this issue that I have noticed over the past couple weeks.

Running barefoot to a G5RV up 30' and about 100' rg8u to the 450 ohm line. Recently noticed the tuner would take longer than usual to tune a frequency and wouldn't tune on 17 and 12, which by the way, 17 and 12 used to tune without any big delays. Also noticed something interesting: where I am able to tune (40 meters as a favorite) I noticed the recieve S-meter readings would drop significantly so that I would not have an accurate signal report on the signal I was receiving. I found that powering off the rig for some time would "fix" the S-meter issue until I tried the tuner again and right back to a very low S-meter reading.

This week decided to replace the G5RV as it was pretty old & fragile with a new one. Basically getting the same results as described above, the only difference being I can now tune on 12 meters with difficulty and only from the middle of the band.

I always unplug the coax from the radio when not in use. Today noticed that if I pull the coax connector somewhat out of the antenna connection (center pin still inserted but the outer casing of the pl-259 not in contact) the rf/S-meter reading jumps right up (no I am not doing this on transmit). Thought that problem was with the short rg-8 extension cable I use to the rig so I tried a different one: and got the same results.

Any ideas? Anything I might be able to fix by myself or be sent out (I am the original owner since 1993, and the original battery has not gone bad yet).

I apologize for this long message. And thanks in advance for any tips you may have.

Hi Rick

That is normal.

When you connect the ground side of the coax with the screw on part of the connector, you are adding more shielding to the line. When you unscrew the connector and pull it out a little, you are removing the shielded part of the cable and picking up a lot more noise. Mine does that, too. Not to worry :-) 73

Rick,
Something you might want to look at is the solder connection on the
TS-450 SO-239 connector. It is common for the small wire connecting the
socket to the PCB board to break. If that's the case, just replace the
wire and you're good to go.

Took a look Phil and the soldered wire looks good.

Another crazy question: when I took the top case of the rig off, I saw the smaller plate that needed to be removed so I could see the so 239 and soldered wire...that plate is screwed on with black colored screws (3 outside and 3 or 4 inside...think I lost a screw somewhere...have the 3 on the outside in, and 3 inside one's going around the perimeter of the plate...I recall a hole in about the middle of the plate - that one I don't have a screw to account for (looked all over for it - nada). Now i am not even sure if there was a screw in that hole in the first place: question is will that make any difference? Sorry for sounding like a moron.

I guess what I don't get is why, say I was receiving you with the plug pulled out so that only the center pin is in contact, I may have an s-meter reading of s9 for instance, and then screwing the ground side back on I may show only s3 or similar. But you are saying this is basically normal?

I have always loved the old 450 and have gotten years of pleasure from it and don't want to see it have problems now. Am reluctant to send it in for service and spend the $$$ when they are only worth about $500 on ebay.

Rick, It could be as Phil described below but I believe your radio is probably fine. The symptom of the receive being better with just the center pin connected is an antenna/feed line problem. With the center pin only connected you now have a long wire. With both the shield and center pin connected the match is most likely so far off that the receive is way down. This could be caused by anything so...
You can diagnose this problem in a second. Hook up a dummy load and see what happens and let us know.

Bob:

Forgive my delay in getting back to you.

Looks like both you and Phil were on the right track. Put the rig to a dummy load - internal tuner worked fine on all the bands it's made for. So after calling Kenwood tech. service and explaining the coax/center-connector-recieve issue it was determined to be a short somewhere in the coax feed line.

Since I have the feed line in sections I took some spare coax on hand and changed out the last section which connects to the antenna (a calculated guess as it's the easiest and quickest section to get to and it has been really cold here in CT!). Voila! Back in the game! My suspicion is that the short is probably at the PL-259 (thanks to Phil thinking connectors!) that connects to the antenna...but that'll be a project for warmer days!!!!

Thanks all!

Hi,
If the coax is shorted, try locating the short with set of auto jumper cables and car battery, with care of course.
Hook one jumper to center conductor on one end of the coax. Hook the other to the coax sleeve by screwing
the PL259 back and sliding it out on the insulation. Connect one cable to battery and then just tap the other
end to the battery post. As there may be a lot of current if the short is solid just tapping the connection is important
as there will be a big spark. If the short is just one strand of the braid shorting in one or the other of the coax
connectors, you likely will blow the short out like a fuse and then the cable MAY BE USEFUL (??) again.

If you want to discover where the short it without attempting to zap it (I'd prefer to know this so that I can look at the location of the damage (just clearing the fault may leave you with further issues when transmitting), you can use a generator and detector. My favourite is an old HP Logic Pulser and HP Current Tracer (great for tracing shorts on PC boards, if done with care), but you can do the same with a signal generator, resistor, and an audio amplifier with small pickup coil.

If you have a audio signal generator (or even the output of a battery-powered radio), set it for about a kilohertz (frequency not important as long as you can hear it) and connect a resistor of approximately the generator's termination resistance from the centre conductor of the coax to the centre/output connector on the generator, and connect the shield of the coax to the shield/ground of the generator.

[You may find nice, spiky square waves easier to hear than sine waves, but use whatever you have.]

Connect a small coil of wire to the input of an audio amplifier (a battery-powered one is convenient, especially if the coax is still in place and runs outside) and hold the coil next to the coax at the generator end. Set the volume until you get a reasonable audio output (if you're not hearing anything you might try a few more turns).

The current will be high until the location of the fault, which means that the signal will couple much better into the pickup coil before the fault. Since the coax is being used as a loop, there is no 'shield effect' that matters.

Run down the length of the cable until the sound level drops rather suddenly, you're now just past the fault.

Hi All,
I recently acquired a 50 MIL S/N TS-850S. Love the rig, but I'm wondering about what the S/N cut off range is for the bad DDS Chips and leaky caps problems are. Wondering if I shouldn't be warming up the soldering iron and planning on some replacements.

Thank you,
Steve KA9MOT

13006. Re: [TS-850_450_690] TS-850S DDS Chips/Cap issues

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-02-01 10:08:18 UTC
From: Jose V. Gavila
Topic: 13005 Message: 13006

Hi Steve,

I have worked on 50+ TS-850S so far... And the first series where I saw the new DDS ICs was on a 308xxxx unit.

But the leaking caps problem, at least from my experience, was not fixed, so I have seen newer units with same problem. In fact, only on 3 or so units there was no apparent leakage but, even on them, desoldering the caps revealed the nasty odour the leakage generates when hot. So my recommendation is to ALWAYS replace the 11 caps on the CAR UNIT. And, please, carefully clean the PCB before putting the new ones.

Of course, YMMV.

Regards,

JOSE

I have a TS 450SAT that works fine in the PTT mode. When I try to operate in the VOX mode, the VOX will kick in when I speak into the mic, but there is no audio. Currently using a Heil HM 10 mic but tried the Kenwood hand mic also. Same problem. Thanks Gary S. WB2FQL

You can also build a poor man's time domain reflectometer if you have an oscilloscope and a function generator. Here is the link. I plan on building one myself.

  Bob:
Forgive my delay in getting back to you.

Looks like both you and Phil were on the right track. Put the rig to a dummy load - internal tuner worked fine on all the bands it's made for. So after calling Kenwood tech. service and explaining the coax/center-connector-recieve issue it was determined to be a short somewhere in the coax feed line.
Since I have the feed line in sections I took some spare coax on hand and changed out the last section which connects to the antenna (a calculated guess as it's the easiest and quickest section to get to and it has been really cold here in CT!). Voila! Back in the game! My suspicion is that the short is probably at the PL-259 (thanks to Phil thinking connectors!) that connects to the antenna...but that'll be a project for warmer days!!!!
Thanks all!

Topic: 13012 Message: 13012

Hello all,

Thank you for allowing me to be part of your group. I have a 2nd hand Kenwood TS-850s which has functioned very well for 2 years. About a year ago, I modified it to open all frequencies by moving a diode from D11 to D9 and it has worked very well for over a year. (I know, I only transmit on frequencies that I am allowed to transmit on by my license, but it's interesting to listen to other fequencies.)

About a week ago, I turned it on and a series of clicks were heard in the right back side and now I cannot hear anything. The antenna, a dipole, is fine. It has an internal antenna tuner, which also works fine. I have removed the mic, used another one, no change. The transmit light now has a very soft, barely perceptable glow that was not there before. When I push the PTT button, the transmit light becomes bright as it normally does. When I do hit the PTT button, then I hear sound through the headphones or speakers, which I have not heard before. I did look at the circuit board, and cannot see anything burned out or loose. It seems as if it is stuck in some kind of weak transmit mode or something.

I can give more information if necessary, but that's the gist of it.

Thank you for reading.

Don't know about your problem, but the Kenwood would have received everything without that mod. It just would not transmit everywhere. Of course, general coverage transmit gives you 60 meters, and I use mine often on that band.

And you only have to clip a diode, not move it. At least on the 3 850s I have had.

Good luck with your issue!

I just got my first HF Rig, a TS-450sat, I wanted to get it hooked up to my computer for computer control and rtty/psk etc...
I understand there used to be a kenwood box that interfaced between the two for serial connections right? But now there are USB Cables? Do the USB cables completely eliminate the need for the line leveler? I see a bunch of the USB Cat control cables on eBay but they all seem to be shipping from China and I won't want to wait until March to set this up. Are there any american suppliers or how hard it is to make the cable yourself?

Secondly, does this cable do the audio as well? Or do i need a second cable for that to do the psk and such?

Thanks for the help!

I got a cable/interface unit from G4ZLP's site for my TS-850.
Works well

ref: (http://www.g4zlp.co.uk/unified/KenwoodCAT.shtml)
USB to your computer (maps to a COM port), Cable supplied for the ACC connector.

Integrates well with Writelog. But, should work with most everything.

I'd address this properly, if you'd have left your name and call at the bottom of your message..... Nice to know what to call another person beside OM.

Hello OM,

The USB cables will work and are less bulky than the IF-232 Interface. I have 2 of the interfaces and one of the cables. If you buy the cable, make sure you get one with an FTDI Chip. Most have counterfeit Prolific chips in them and Windows doesn't like them, Insist on FTDI.

Hi Jason,

No discomfort, I just prefer to address people by name. :)

Audio? No, you'll need separate cables/interface for that.
Here is a great place to start for rig control:
http://www.ebay.com/itm/FTDI-USB-Remote-Control-CI-Program-Cable-Kenwood-TS-690-TS-790-TS-850-TS-850SAT-/161357479853?pt=LH_DefaultDomain_0&hash=item2591a7bfad

Very few ads will advertise who makes the USB interface chip. Unfortunately, FTDI has come under some bad light recently. Many of the very low cost (usually ebay) USB devices have counterfeit FTDI chips, right down to the laser etched logo. FTDI decided to do something about it and on a Windows Update in October, they changed their driver to change part of the eprom on the chip, rendering the counterfeit chips useless.

Of course, everyone jumped on FTDI for "breaking" their devices with the counterfeit chips. I believe FTDI has since changed the driver so that it will not work with the counterfeits, but also will not alter them.

I still recommend FTDI chips over Prolific, they've been having counterfeit problems for years, and as someone else stated, the real drivers don't always work.

The original Kenwood interfaces (IF-10 series?) were TTL (radio) to RS232 (computer) converters. There are several designs on the web using MAX232 chips (and others). QST had an article in '93 or so, I built up a few PCBs for the local hams. But these days, most computers don't have RS232 so you need a USB converter anyways. May as well get it all in one box if you can.

All this gets you is computer control of the rig parameters (VFO, frequency, mode etc). Actually sending/receiving anything (data, CW...) requires a separate interface, either sound card or a single transistor or two for keying.

Interfacing to your sound card is easier than most people make it. Look for K9YC's interfacing paper. It all comes down to grounding all of your stuff together, and a simple resistive divider on the audio leads. You need a second COM port or real LPT port for PTT and CW control, most modern software can't use the same port that's controlling the rig.

Good luck and enjoy the great radio (and replace C104 if it hasn't been done already).
Dave AA3EE

Guess that is a CB setup. Radio is set on CB channel, which is illegal.

I was going to say anything because it is perfectly legal to listen to CB on your rig.....not sure why you'd want to, but for the sake of argument. I was gonna comment on the 3 "pill" 500 Watt non working amp, but then again.......

I decided to go ahead and comment about the Outlaw CBer after watching the video of his QSO with Germany on 27.385......

Just another black eye for radio operators everywhere. Who'd pay $1,000 for that junk anyway? Waste of a fine rig....

Yes - listening is fine, but I'm sure the picture was to show that it would transmit on the CB frequencies. If I wanted to sell my TS-450, I sure wouldn't park it on 27 megs. I also noticed the 'pill' notification. Wasn't sure what them meant until I saw the frequency :-) 73

This has happened to me before. The radio needs to receive a command to release PTT from the computer. You can open the software again and click PTT again, which should send a command to the radio to stop transmitting. May take a few seconds for the serial port on the computer to respond, especially using a USB converter.

As far as I know I am the only moderator around right now. I have been unable to reach the list owner, Jon KD5SFA, who is supposed to be my backup. I am dealing with several family health issues that will have me away from email for several days at a time so unable to approve any membership or message requests until my return. This will probably be the case for some time. I appreciate your patience during this time.

If anyone knows Jon, would appreciate knowing if he is OK. I have not heard from him in some time.

Rick,
After I was given a MC-60A to go with my 450SAT, I asked the same question. Especially as I had to replace the corroded battery box (no other damage). I didn't get a definitive answer, so here is my 'opinion'.

In theory, probably not as the basic mic has plenty of output to drive the radio directly. However, actual on-air tests have shown some improvement in 'punch' without over-driving the radio. I DON'T use the processor, and don't "swallow" the mic. On-air audio reports I've received also says it sounds a bit more "robust" without over-driving.

Best thing you can do is put it on the air and experiment, preferably with somebody on the other end who knows your voice.

I agree with Phil. No amount of electronic test equipment can duplicate what the human ear hears. Working with audio whether or not it's a radio, tape deck, or ? audio can be changed beyond what test equipment can read.
Last time I got a "new to me" mic, I got on the air with a friend and did some tests. Like Phil said, he knew my voice.
I would say keep the ALC meter within range and get on the air.

Agreed. With voices and ears and radio, providing the most accurate reproduction of the original doesn't always ensure the best ability to get the communication through, nor to be the most pleasing to listen to. Right from the start, our radios are purposely limited in audio bandwidth to keep RF bandwidth down, so as long as your communications are getting through, and the people at the receiving end prefer to hear you with whatever mike/equalisation/speech processing you use - you're doing it right. :-)

I have a Kenwood TS-850S. On 80 Meters SSB I get 100 watts output into a dummy load, So I know the radio is capable of full power. However, On other bands the power is less. It only makes 30 watts on 160 meters, and 45 watts on 10 meters, 55 watts on 15 meters. All with the internal antenna tuner turned off, power and carrier turned all the way up. The dummy load is flat on all bands. Power is low on the antennas too. I run a fan dipole made for 20m, 40m, and 80m.I allso have low swr under 1.5 on 15m on that antenna as well. I allso have an Antron 99 for 10 m. I have the service manual. Last night I was testing the radio further and noticed that it makes a little more power cold than it does after it warms up. After it runs for an hour or so the power drops about 10% on all bands. The power supply is holding voltage very well during transmit.

I need to know how to balance the power out between all bands. And have some idea what would make it loose power as it warms up.

From (Thanks N6TR):
http://www.kkn.net/n6tr/850repair.html#Reduced_receiver_sensitivity_and_transm
A most helpful page!

Reduced receiver sensitivity and transmitter output as you increase
frequency (N6TR)

This is the typical symptom from the most common component failure I have
heard of in the 850. The cause is that some of the band pass filters on the
RF board are always enabled by the 74LS145 decoder chip. You can verify
this by using a voltmeter and seeing if one of the outputs from the chip is
always "low" (near zero volts).

I would suggest putting a socket down on the board for this IC - so if it
ever fails again, you can replace the part quickly. This will require
removing the RF board (which is the one underneath the radio with the shiny
shield on it). The IC is under this shield.

I have received a comment that Kenwood often replaces a MI303 diode when
replacing this chip (thanks K5TSQ). There is mention of a modification on
the Kenwood site that might also help eliminate this failure. Check out the
service bulletin for more information.

I believe this failure might be a result of a high RF voltage being
presented on the receiver input. I do think one or two of the failures I
have seen might have been caused by transmitting with full power with a
different radio with antennas that were close. It has also been suggested
the 47K ohm DC input resistance of the receiver could easily allow nearby
lightening hits to produce a high voltage.

Push "rec" for #1, 2, or 3, for example, then speak or send CW. As soon as you're finished press "Clear" With "VOX" off, push "play" #1 to verify that it sounds ok. With VOX on, it will transmit.
Hint, when recording, press clear ASAP when you're finished speaking/sending, since that's when the radio will return to receive.
Your mic gain will effect the audio level just as if you were using the mic.

Long time HAM. Long time TS450S user.
So what's the purpose for the dB meter (AF Level) on the front of the display.
Nothing in the instructions about its purpose.
Nor in the service manual
Perhaps it has something to do with the digital unit (which I don't have).
Inquiring minds want to know.

Alan,
You're inquiring about the TS-450/690's RX Meter function. The RX Meter is turned on and off with the "RX M" or #3 button. Per the manual: "When this key is pressed during reception, the dB display turns on and off. The AF level is displayed on the scale (dB), independent of the AF volume control setting." It's actually one of my favorite and most useful features of these rigs. Here is a copy of a post I made to this list back in 2013 on the topic:

One of the best features of the TS-450/690 that you don't find in other rigs (even it's big brother the TS-850 and subsequent rigs) is the RX Meter. In my informal polling on the air and online, most operators using the TS-450/690 don't understand or don't use this powerful feature. Most may have it engaged, looking at the bar graph LEDs flicker away reflecting received audio level, but do nothing more.

The power of this feature shines when used in combination with the RF Gain adjustment. Once a desired signal is tuned in with desired filtering, with the RX Meter active, back off the RF Gain until the peaks of the receive signal on the RX Meter bar graph just start to come off the 0 dB point. This is that magical sweet spot point where AGC is not backing off the desired signal, resulting in maximum signal to noise. Back off RF Gain further and you start to reduce the desired signal. Back off RF Gain less from this point and you increase noise and AGC starts to cut back the desired signal.

It really is a powerful feature that I wish was incorporated into other rigs. In fact I don't know of another rig that has it. Anyone know of one? I don't know if Kenwood has incorporated it into its latest rigs (TS-590 / TS-990). Perhaps someone could tell me that. If they did, I'd be inclined to relegate my TS-690 to backup rig status and upgrade.

I also like to turn on the peak-hold feature that the RX, TX and S-meters have. It's turned on and off via the LSB/USB Power-on Menu, #08 (Section 4.11-15 of the operating manual).

Hope this information help.

The "S" meter is the "S" meter.
The "dB" meter is below the WATT meter and below the ALC indicator.

Press the RX M (the number 3) button and the "dB" meter will turn on.

So I guess you don't know what its for....

Steve, that is obvious. I read that in the manual. But the manual doesn't explain what the dB meter is used for. See CORRECT AND BEST ANSWER BELOW:

THANK YOU PAUL FOR THE BEST AND MOST COMPREHENSIVE ANSWER ON THE USE OF THE dB METER ON THE TS-450S.

PS to Paul: I've always backed off the RF GAIN control since 1984 on my tube receivers while on CW and SSB. It's the way to do it! (I just never tied the dB meter to the RF GAIN control on my TS450S!) HAMS know this, appliance operators have no clue! (That is the proper use of RF GAIN control.) It's like transmitting at maximum power (and turning on the linear (because you like to see your lights flicker) even if you are talking to your friend across town. No clue! (Boy am I going to start a flaming thread here or what?) Let's see who are HAMs and who are LIDs! Easy to figure our based on their comments.

Alan,
You're inquiring about the TS-450/690's RX Meter function. The RX Meter is turned on and off with the "RX M" or #3 button. Per the manual: "When this key is pressed during reception, the dB display turns on and off. The AF level is displayed on the scale (dB), independent of the AF volume control setting." It's actually one of my favorite and most useful features of these rigs. Here is a copy of a post I made to this list back in 2013 on the topic:

One of the best features of the TS-450/690 that you don't find in other rigs (even it's big brother the TS-850 and subsequent rigs) is the RX Meter. In my informal polling on the air and online, most operators using the TS-450/690 don't understand or don't use this powerful feature. Most may have it engaged, looking at the bar graph LEDs flicker away reflecting received audio level, but do nothing more.

The power of this feature shines when used in combination with the RF Gain adjustment. Once a desired signal is tuned in with desired filtering, with the RX Meter active, back off the RF Gain until the peaks of the receive signal on the RX Meter bar graph just start to come off the 0 dB point. This is that magical sweet spot point where AGC is not backing off the desired signal, resulting in maximum signal to noise. Back off RF Gain further and you start to reduce the desired signal. Back off RF Gain less from this point and you

increase noise and AGC starts to cut back the desired signal.

It really is a powerful feature that I wish was incorporated into other rigs. In fact I don't know of another rig that has it. Anyone know of one? I don't know if Kenwood has incorporated it into its latest rigs (TS-590 / TS-990). Perhaps someone could tell me that. If they did, I'd be inclined to relegate my TS-690 to backup rig status and upgrade.

I also like to turn on the peak-hold feature that the RX, TX and S-meters have. It's turned on and off via the LSB/USB Power-on Menu, #08 (Section 4.11-15 of the operating manual).

Hope this information help.

Based on his initial post, I thought he knew NOTHING about it. That is why I quoted the manual to give him a place to start. I didn't realize he was a smart-ass know-it-all attempting to make fools out of us. Hey, that's OK. This has been a great reflector up this point. So, I guess he wins for being the biggest ass-hole so far. Two winners.

Hello to all -

I just joined the group and this is my first post. I have a subject radio and need to replace the 6 pin Molex DC connector on it. I would also like to assemble some of the DC mating plugs. Could someone please share the Mouser or Digi-Key part number for these items? I already have the 0.093 male and female pins, so, I only need the shells, and maybe the boot for the plug. Thanks & 73 - Mike

Be careful using the .093 pins. I read somewhere that the original Yaesu/Icom/Kenwood power connectors used pins spec'ed in Metric and weren't quite a perfect match for the US equivalents, sometimes causing overheating because of a loose fit. I've never verified this myself, though.

Last time I looked, the Molex equivalents had the keyed portions facing the wrong way so they would not mate with the radios. I bought a few pairs and made short pigtails using the factory radio plug at one end, and a 6 pin Molex at the other. These days, I'd be tempted to do the same but with PowerPoles.

Reed –

Thank you for a useful site. However, as I already have the pins, all I need is the shells. I looked on both Mouser and Digi-Key, and found similar shells for about $0.50 each. I just figured someone on here has already gone through the exercise and knows exactly what is needed. There are too many to choose from, HI. Seems like a more cost effective way to go, and, I also get exactly what I want and not something else. Thanks & 73 – Mike

Dear Friends

While now a send a query to the reflector over a delay (after a time) of tx/rx in my ts-850, the problem was worse after having a return of rf in a poor connection of an antenna on my Ten Tec Corsair, with the problem of the loss of reception attenuators. After that when you turn on the computer I have reception for a few minutes and then the reception is lost. Be suspicious of the famous d31 and found that it was not right since reception was returning for a few seconds press tx and then returned to leave. Replace the D31 with 2 1n4148 series and works very well.
The problem is that to turn it on it has the same problem within 2 minutes reception fades and goes after a couple of minutes and the team is working perfectly (I left it in reception more than 24 hours without problems, there is tx problems). Make a measurement at the anode of the d31 and the power is 0v then continues to rise 02, 03, 04, until reaching 08v. there short reception, and after a few minutes back stage at the anode of d31 06/07v in that State the equipment works perfectly. As I have seen it would have to be at that point 0v and comes from the base of q5. Which may be his understanding of the component that this failing. Taking into account the return of rf who comment on them.

Thanks a lot
Gus

Well, today I fired up the TS450SAT, 7235KCs, hit AM and keyed the TX to tune the outboard MFJ-993B tuner (with the 4:1 internal balun and instant memories I prefer it over the internal tuner in the 450). On 7235-7240KCs the tuner is usually instantaneous as that's my primary operating area.

Well, there didn't seem to be any RF (I usually tune with a 25Watt carrier). Turned up the carrier power and suddenly the tuner went bonkers like it was trying to tune on some totally different frequency! Indicated power was only about 15W. Then it stopped and there was NO output power.

What it does NOW. There is no output carrier power on either AM or FM, neither is there any ALC action. If I select LSB and whistle into the mic I DO get some ALC indications and a very low power indication on the MFJ. Again, the MFJ goes bonkers like it's trying to tune on some weird frequency and the MFJ freq counter also goes bonkers, nothing anywhere near the 40M band.

NOTE: I've also tried tuning it with the internal tuner just in case the MFJ had a problem, but that doesn't work either.

All indications are that the finals are probably OK as it 'tried' to put out power, and I see ALC action on a whistle. . .

I've pulled it out of the operating position and put it on the workbench. I've torn it down to the PA unit so that I can test the final & driver Xistors, but I REALLY suspect the DDS is shot. Yes, this unit has the early DDS board, from all I've read a known and common failure mode. Also, from what I've read in one of the troubleshooting files posted in this group, the DDS board is NO LONGER AVAILABLE :(

13082. My "Kaput" TS-450SAT, update

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-03-06 15:43:04 UTC
From: Phil
Topic: 13082 Message: 13082

Well, yesterday afternoon/evening I did some extensive troubleshooting, here are the results.

1. Checked final & driver Xistors, lifting their legs from the PC board, they're OK.

2. Since it does have some output in SSB mode I tuned the Icom R-71A to 7240, ditto the 450 (into a dummy load). Audio was clean and sounded good, peaking a bit over 100 Watts. So I presume that the reason the rig only showed about 15 Watts, give or take into the MFJ Auto-tuner/antenna is because the tuner CAN'T tune on just voice peaks. This tells me that the basic "RF chain" (the modulator, Transmit IF strip, final board & filter board) is all good.

3. There is NO output on ANY mode that requires a carrier output. That includes AM, FM, CW or FSK. Of course, the MFJ antenna tuner (and I presume the internal one) requires a steady carrier to tune on. That is why I had such erratic results when trying to tune on a "whistle". My "whistler" doesn't exactly create a clean steady tone for tuning ;-)

4. I read all the applicable docs that are available on this site. Didn't seem to be any service manual available though. However, searching the various manual sites in my favorites folder turned up one at the KO4BB manual site. So I need to spend some time perusing said manual now.

5. Since it seems to have a "missing carrier", that would lead me to believe that one of the DDS chips on the Carrier board is bad. Yes, this unit has the 'early' 6631 DDS chips, a part that is a known trouble source (and apparently no more boards available from Kenwood).

6. There is a 'remote' possibility that the problem lies in the carrier level control circuitry and later this afternoon I'll explore that area (we have an income tax appointment this morning).

13083. YIPPII! It's a bad Carrier Pot! Anybody have one from a parts rig?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-03-07 03:12:49 UTC
From: Phil
Topic: 13083 Message: 13083

My original thought was that this rig had a bad DDS on the carrier board. Transmit on SSB, but NO carrier on AM, FM, CW or FSK.

Well, today I pulled the front panel off and checked the resistance of the carrier control, VR5. It's 10K across the entire pot like it should be, but the wiper is open, apparently not making contact at all. I tried to force a bit of DeOxit D5 through a couple small holes, but that didn't help any.

Monday I'll call Kenwood and see if they 'might' have a replacement pot, but considering the age of the unit I'm not going to hold my breath. . .

IF all else fails, I'll take a couple small resistors and use them in place of the pot, OR on the other hand I could "remote" a small pot elsewhere in the rig. Considering the age and cosmetics of the rig I'm not concerned about how original it is so long as it works.

Anybody here have the right pot??

Hi, Scott:

A suggestion if you are new to buying online. See if your bank/credit card has 'one time credit card numbers' (sometimes called 'one use numbers'). My bank (Citibank) has them, where I can set a maximum $ amount and even a time limit (the default is a month, so I usually don't set the time limit!), which I use with web sites that I don't trust to have my full account (especially when ordering from China). Yes, it's more online banking, but it is the best way that I've found to restrict misuse of my credit card information.

Part of my job is IT security - and from much more illustrious specialists than I: you're in more danger of identity theft from your local restaurant, home improvement centre, or supermarket than from most online purchases or online banking. (Think: Target, Home Depot, and Lucky.)

I don't use a Paypal account either - due to the way that they limit accounts - but I've done many, many individual, 'guest' transactions via Paypal without issue. Paypal itself is safe enough, it just has onerous policies where they want access to your chequing account if you spend more than certain amounts, and I don't agree with that practice. Checking out as a guest (and entering those magic one-time credit card numbers) gets around the limits, and should limit your possible losses to the amount of that transaction.

The Internet doesn't have to cause you troubles, but you are absolutely right that you need to careful about how you spend money there.

You're welcome to contact me for more help with buying things online. One caution - never, ever give your account information to anyone who offers you help (unless you know them personally) - even if they are trying to help you. That would include me - you don't know me well enough, but I'm quite willing to help you (but I really don't want any of your personal data!).

When dealing with your bank, always use the number printed on the card. If you ever get a message on your phone that purports to be from your bank - call the number on your card, and explain the situation. This is to make sure that you're talking to your bank and not giving your information away to troublemakers.

- Richard, VE7CVS

Without tearing my rig apart, I don't know the size specifics of this pot, but I can't think of a single pot that can't be replaced very inexpensively

with an replacement.
If your Google Foo is week, send me a picture of the pot that has some kind of size reference included in the picture (Pencil eraser, ruler, etc.) so I know how large/small it is, and I'll google a replacement for you.

There is absolutely no reason to "cobble" up a repair. Fix it correctly.

Yabbadabbadoo! Phil, I'm glad it's something simple. I remember asking you about the carrier adjustment which I like to remind everyone that it has to be set at a certain level but I didn't think the pot was bad. celebration time!73, Bob WE6C (just a hundred or so miles north of you)

Subject: [TS-850_450_690] YIPPII! It's a bad Carrier Pot! Anybody have one from a parts rig?

  My original thought was that this rig had a bad DDS on the carrier board. Transmit on SSB, but NO carrier on AM, FM, CW or FSK.

Well, today I pulled the front panel off and checked the resistance of the carrier control, VR5. It's 10K across the entire pot like it should be, but the wiper is open, apparently not making contact at all. I tried to force a bit of DeOxit D5 through a couple small holes, but that didn't help any.

Monday I'll call Kenwood and see if they 'might' have a replacement pot, but considering the age of the unit I'm not going to hold my breath. . .

IF all else fails, I'll take a couple small resistors and use them in place of the pot, OR on the other hand I could "remote" a small pot elsewhere in the rig. Considering the age and cosmetics of the rig I'm not concerned about how original it is so long as it works.

Anybody here have the right pot??

Hi Steve,
Yes, and normally I'd agree with you. I've been "doing" electronics for over 60 years, Military, Government contractors, audio service etc, and this puppy seems to be a "made to order" part for the rig. A small (~3/8" square PC mount with about a 3/8" shaft that is roughly 5/8" long with a flat for the knob.

I'm going to check with Kenwood and see if they have them in stock (I DON'T do eBay), and if they don't I'll "remote the pot", sort of like some folks have "remoted the battery for easy replacement" as I only need to preset it one time so the antenna tuners can function (I 'll set it for about a 25-30 Watt AM carrier).

This puppy is NOT easy to get to, buried deep in the front panel. . .

Hi Steve,
I said 3/8" shaft, I should have said "about a 1/8" shaft ~ 5/8" long".

Don't really have a good way to get a picture.

Hi Bob et al,
Yes, Yabbadabbadoo!

This morning I went ahead and did a "temporary" fix by remoting a small 10K pot on short "flying leads" inside the radio just so I could use it. Totally reversible if/when I can get a new control. NO cutting or hacking up the radio etc. I pried the back off the bad pot and used a small screwdriver to remove the resistive element from the pot, reinstalled the pot and knob, and then pre-set the power level to 100W with the new internal pot (which the power output control can still reduce).

This gives me time to try and get a new pot.

HOWEVER, since it DOES work now, I think that I'm probably going to sell the radio and put the money towards a new Icom IC-7200. We just filed our taxes and it seems like a good time to "take the plunge", especially as 'wifey' is amenable to it. As my 'primary' DXing hobby is chasing NDBs (longwave beacons) the IF DSP (narrows down to 50Hz) etc of the 7200 is more suitable to that hobby (that's why I have a 250Hz filter cascaded with a 125Hz one in my Icom R-75 receiver).

Would Mouser part number 858-P260P-S1AF3CB10K fit? I haven't seen the actual pot in the rig yet, but I've found this series of pots often fit well in the tight spaces of some rigs.

Not knowing the size of the pot or how it's attached, once or twice I've disassembled pots to re-tension the wiper, and/or clean the resistance more precisely than squirting tuner juice inside. It did help.

Another factor is if the shaft bushing is worn or not.

Hope this helps, Mike N2MHO

Hi Mike,
I did pry the thin plastic back cover off the pot (it's riveted on) and examine it's guts. Turned out that the small piece of plastic that fastened the wiper to the shaft had fallen apart and the wiper was floating free. It's all very small in there, I did try to epoxy the wiper to the shaft but that was futile. That's when I took a jewelers screwdriver and pried the resistive substrate off (to remove it from the circuit), then mounted the pot to keep knob etc intact, and put a small one on flying leads inside the radio. . . Radio works fine now.

Today I'll contact Kenwood and see of they have one, if so I'll order it to install the next time I have the radio on the bench.

In any case, now that it's working, I'm probably going to "Fire Sale" the rig (local pickup only) and replace it with an Icom IC-7200. That should last me the rest of my life :)

Phil, you could also try pacparts.com, I bought some KWD HT parts from them once.

In some cases they might offer a generic replacement instead of the OEM part.

13099. Sold my 450, thanks to all the folks who've helped me here.

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-03-10 03:38:01 UTC
From: Phil
Topic: 13099 Message: 13099

In talking to some locals on the 2M tonight I mentioned I was planning on selling the 450 at a "fire sale" price to get a new radio. One of my friends said he'd take it for my asking price, and tossed in a fully functional Kenwood TS-130 as a 'freebie' as he said he felt my price was too low. AND YES, he is fully aware of the repair I made by replacing the front panel carrier level pot with one inside the radio on 'flying leads'.

He'll pick it up in the morning.

I wish to thank all here who helped me and made suggestions. I'll probably be signing out of the group once he's picked the set up.

13100. TS850s Caps

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-03-10 08:03:13 UTC
From: gm4hrl@...
Topic: 13100 Message: 13100

Hi everyone,

As a new member to the group I'm looking for some info on the cap replacement on the TS850s

I know this subject has been covered a number to times within the group but one thing I can't fined is what are the
1. Quantity of each cap required
2. The values and voltage rating required
3. which boards do they effect
4. Is there anything else I should address
I know about the lithium battery, it will need replaced.
which is the best type to replave it with, i.e. solder in or using a carrier for a button cell.

I know my rig is getting on in age and its a good rig and like a number of guys I dont have the funding to replace the rig. So I'm looking to keep this rig a live for a number years to come.
I have done a number of mods that I have found on the web to improve it.
The only other thing I would like to try and do is put some more fillters in. getting the original type is a problem so aftermarket one's would be the only option.
Does any one know who does an aftermarket filter, I'm mainly looking at filters for CW 500Hz

Thanks
Tony GM4HRL

Tony, There's always plenty of filters on e-bay. You can also get them through "Inrad" which some people say are better. Finding filters will not be a problem.Maybe someone here has a spare filter???
A couple years ago I sent my 850 to Clif Avvid in Texas to have him go through it. The radio had no problems but I wanted it to last me another 20 years. He checked things and replaced a few suspect caps, aligned etc. Maybe you can look into doing the same thing. Shipping may be an issue for you though.
I don't have the funding for a new rig either but even if I did I would stick with my 850. I like it that much. But there is one exception, a new Kenwood 990 but I don't have a spare 8 grand laying around!

There are quite a few files in the Files section dealing with this. In the folder "TS-450_690" there is actually a file called "TS-850_Carrier_Board_Cap_Replacement_W6OT.pdf" which shows the 11 capacitors to be replaced on the CAR board, and the Mouser part numbers for suitable replacements. The file "TS-450_690_Commom_problems_DV1TBX.pdf" shows the two capacitors on the display board that usually go bad. If you browse through the other files, you will find the rest covered. The two I just mentioned cover the commonest ones. You may have to bypass some traces with fine wire if the leakage from a capacitor corroded and ate away the traces on the board.

Hi Tony

I've recently overhauled my 850 replacing the capacitors on my carrier & display boards. These are the two boards that can cause operational issues if the capacitors leak.
There are aftermarket spares kits available but basically, you should replace all caps with same value but a higher operating voltage. Up from 16 to 25 volts.
I've also fitted a CR2032 battery holder on the control board that allows me to replace the battery easily when required.
There are some horror stories about capacitors leaking on the carrier board and causing all sorts of issues even leading to failure of the DDS chips which are no longer available so I highly recommend these caps are changed as a minimum.
Geoff at Castle Electronics in Wales will provide a full overhaul and service if you don't wish to undertake the work.

Filters for the 850 are readily available on ebay or Inrad filters via Vine Electronics or directly online.

Regards

Drew

Thanks Bob,
I will have a look at inrad and see how much they are.
Getting the rig checked I should be able to do that my self as I was in the industry for 25 years and have been able to pick up a HP8920 RT test set.
I was more concerned about the caps so I could order them in a higher quantity and get a better price, as there is usually price breaks.

reading some things in the group there has been some odd ball falts crop up, so i was looking for some pointers on more common faults that may crop up

I just did these replacements about 6 months ago. I don't know how expensive it is for you to order from Mouser overseas, but the referenced Mouser replacement capacitors fit quite well into the places where the old ones were. I was lucky in that 6 out of the 11 capacitors on my CAR board had leaked but they had not damaged the board. The CAR board is very easy to get to and remove.

The display board is even easier to get to. The leaky cap on that board DID damage traces in my 850. It was pretty easy to bridge them with small pieces of wire, though.

I got a CR2032 coin cell holder and installed it near the original location board with some double-sided foam tape. I ran wires to the board where the coin cell was. Note - if your coin cell has not run down, it is probably maintaining the memories in the radio. When you remove the coin cell, the radio loses the memories. So if you have frequencies in the memories you want to keep, make a table of what you have so you can re-enter them afer replacing the battery.

Don't forget the cap on the audio board. If I remember it is C187. Cap leaking manifests itself by unworking or low audio. All the parts from Mouser, which are the 11 caps on the carrier board, the one on the display board and the one on the audio board, plus the battery holder were about $20 total. I think I have Mouser invoice with the part numbers.
   There was somebody in the U.K. who offered replacement kits with the SMD caps for the carrier board for about GBP 9.95. I believe he was in Essex. Might check E-Bay

Tony, Someone wrote here a while back that one (maybe more) of the electrolytic's was a 16 volt. That's cutting awful close in my opinion. Maybe replacing that/those with 25 volt would be better.Something to think about.
Glad you can do this yourself. It'll save you a lot of shipping. For myself, my hobby is working on and fixing little transistor radios and "AA5's" (All American 5 radios). These 850's are a little much for me after working 50+ hours a week. It would be more like a job than a hobby so I let Clif, the expert, take care of mine.73, Bob WE6C

Subject: Re: [TS-850_450_690] TS850s Caps

I just did these replacements about 6 months ago. I don't know how expensive it is for you to order from Mouser overseas, but the referenced Mouser replacement capacitors fit quite well into the places where the old ones were. I was lucky in that 6 out of the 11 capacitors on my CAR board had leaked but they had not damaged the board. The CAR board is very easy to get to and remove.

The display board is even easier to get to. The leaky cap on that board DID damage traces in my 850. It was pretty easy to bridge them with small pieces of wire, though.

I got a CR2032 coin cell holder and installed it near the original location board with some double-sided foam tape. I ran wires to the board where the coin cell was. Note - if your coin cell has not run down, it is probably maintaining the memories in the radio. When you remove the coin cell, the radio loses the memories. So if you have frequencies in the memories you want to keep, make a table of what you have so you can re-enter them afer replacing the battery.

There's a guy on the UK ebay selling sets of caps for the 850 and his are rated at 35v and the price was quite reasonable. 16v is too near the rail voltage of 12v This is probably why they start leaking when they get older and tired.

Tony, Right! I wonder why Kenwood would cut it that close. I know when you study capacitors there's an entire library on them so maybe Kenwood wanted these particular caps to run at close to their voltage rating? Not sure why that would be but the designers are smarter than I!Anyone have an idea on that?Bob WE6C

Bob,
One of the things that can be a factor is cost. Also they did not think that the 850 would last this long, so you could say it's built in obsolescence. It's the same with some of the IC's you cannot get them any more not without going through some companies who specialise in searching for obsolete components. But with this old a rig it would be highly unlikely to find them. After 10years depletion of certain components is quite rapid. At the time of design there can also be a shortage of certain components so that can be a factor to what they chose or they may have had a large stock from other projects.

Because, as much as I really enjoy my Kenwood rigs, one or more of the Kenwood engineers back then cut corners on a number of rigs with capacitor ratings - the TM742 (and similar) radios have this problem as well.

Do up the ratings (I don't use anything less than 25 volt caps in a 13 volt circuit), and buy from reputable 'authorised' sources (e.g., Mouser and Digikey in the US) because there are a lot of 'counterfeit' parts out there, it's become the bane of the supply chain. I buy cheap caps from Hong Kong for breadboarding, but my rigs get caps from reliable vendors - it's too much trouble to fix a rig again to save a buck or two on caps.

Tony, You're probably right but they had to know that the 850 was not your ordinary radio and it would be very desirable for many years. Just my opinion. Cutting costs 99% of the time doesn't pay.Bob WE6C

I know when you study capacitors there's an entire library on them so maybe Kenwood wanted these particular caps to run at close to their voltage rating? Not sure why that would be but the designers are smarter than I!Anyone have an idea on that?Bob WE6C

There's a guy on the UK ebay selling sets of caps for the 850 and his are rated at 35v and the price was quite reasonable. 16v is too near the rail voltage of 12v This is probably why they start leaking when they get older and tired. Tony GM4HRL

Tony, Someone wrote here a while back that one (maybe more) of the electrolytic's was a 16 volt. That's cutting awful close in my opinion. Maybe replacing that/those with 25 volt would be better.Something to think about.
Glad you can do this yourself. It'll save you a lot of shipping. For myself, my hobby is working on and fixing little transistor radios and "AA5's" (All American 5 radios). These 850's are a little much for me after working 50+ hours a week. It would be more like a job than a hobby so I let Clif, the expert, take care of mine.73, Bob WE6C

I just did these replacements about 6 months ago. I don't know how expensive it is for you to order from Mouser overseas, but the referenced Mouser replacement capacitors fit quite well into the places where the old ones were. I was lucky in that 6 out of the 11 capacitors on my CAR board had leaked but they had not damaged the board. The CAR board is very easy to get to and remove.

The display board is even easier to get to. The leaky cap on that board DID damage traces in my 850. It was pretty easy to bridge them with small pieces of wire, though.

I got a CR2032 coin cell holder and installed it near the original location board with some double-sided foam tape. I ran wires to the board where the coin cell was. Note - if your coin cell has not run down, it is probably maintaining the memories in the radio. When you remove the coin cell, the radio loses the memories. So if you have frequencies in the memories you want to keep, make a table of what you have so you can re-enter them afer replacing the battery.

Subject: [TS-850_450_690] TS850s Caps

Hi everyone,
As a new member to the group I'm looking for some info on the cap replacement on the TS850s I know this subject has been covered a number to times within the group but one thing I can't fined is what are the 1. Quantity of each cap required 2. The values and voltage rating required3. which boards do they effect4. Is there anything else I should addressI know about the lithium battery, it will need replaced.which is the best type to replave it with, i.e. solder in or using a carrier for a button cell.

I know my rig is getting on in age and its a good rig and like a number of guys I dont have the funding to replace the rig. So I'm looking to keep this rig a live for a number years to come.I have done a number of mods that I have found on the web to improve it.The only other thing I would like to try and do is put some more fillters in. getting the original type is a problem so aftermarket one's would be the only option. Does any one know who does an aftermarket filter, I'm mainly looking at filters for CW 500Hz
ThanksTony GM4HRL

Subject: Re: [TS-850_450_690] TS850s Caps

Because, as much as I really enjoy my Kenwood rigs, one or more of the Kenwood engineers back then cut corners on a number of rigs with capacitor ratings - the TM742 (and similar) radios have this problem as well.

Do up the ratings (I don't use anything less than 25 volt caps in a 13 volt circuit), and buy from reputable 'authorised' sources (e.g., Mouser and Digikey in the US) because there are a lot of 'counterfeit' parts out there, it's become the bane of the supply chain. I buy cheap caps from Hong Kong for breadboarding, but my rigs get caps from reliable vendors - it's too much trouble to fix a rig again to save a buck or two on caps.

I've been ordering parts from both Digi-Key and Mouser for many years.
Each stocks some parts that the other doesn't. Both are fast for me.
Digi-Key in Minnesota and Mouser in Texas take about the same amount
of transit time to Illinois. Both ship the same day as the order if
it's before 4 pm.

Recently picked up a 450s. On CW and AM ALC is fully adjustable on the scale. On SSB even with the Mic gain fully clockwise and yelling I get nothing on the ALC scale yet seems to be puting out full power. If I back the power down to about half way I get ALC and can adjust with mic gain. Is this normal? I am used to using an 830s and unsure.

I think I've got a handle on this issue , it has been intermittent many times as a set up to test , it works normal .
At a time when it not working correctly , it will go to a max of 5-10 watts and then fall to zero output , but only in SSB , but full out put in other modes .
Many times it I try to spin some pots like PWR , AF etc. some times I get power back .
I have read a couple other similar power issues , like filter issues , DC-DC board , but it seems that from what I have read , there is no return of Tx power ?

Thanks John

CAR knob doesn't seem to change anything except on AM modes. I set the mic gain till I got full power speaking normally the backed it off some and I get good audio reports so I guess I can live without the ALC indication, but may be more concerning when I get around to using digital modes. I just don't want to be the guy that splatters all over the band. I would not be surprised if someone had "made adjustments" before I purchased the radio trying to pump more power out. It seems stock watts still because I get 105 watts dead key on AM.

Paul,
I understand now. Have not heard of anyone doing that on this group, but you never know.
 Good luck and enjoy those kenwoods.
Best 73,
Tom AF8P

13136. TS450S Firmware ?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-03-21 11:25:52 UTC
From: peterdstanford@...
Topic: 13136 Message: 13136

Hello Gentlemen, I am new to this forum and have just received a TS450S which has needed some TLC. All the usually suspect issues C104, some tracks corroded etc. It now all functions (I believe) as it shoudl except I Think the firmware (eprom) may be on the blink. To start the radio up it takes a few goes on the power button and when it finally does start up it is not behaving as it should. RX seems restricted and can only tunes upwards on some bands and occasionally when outside the Ham bands it jumps to 63MHz. All VCO measure good and voltages are ok. With Care I can tune the whole HF band.

The EPROM in the unit is marked JHXA and when I run the check sum it gives me 892b instead of 862b which I think means its not correct. I have the necessary burner etc to reprogram but no .bin. Has anyone in the group ever 'read' out a working Eprom? or know where I can download one from. Currently this is the only transceiver in the house and I would like to get it going...

Anyone?

Best wishes all , Pete VK4GXC

13144. TS 450S no power out

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-03-31 20:10:17 UTC
From: wallroy@...
Topic: 13144 Message: 13144

I picked up a TS450S that is not working. I checked and there is no power out on any band. I tested the finals and they look ok. I used a Huntron 2000 for the test. So I checked the current draw of the radio: rec is about 1.2 amps; with send button push no audio it is drawing 2.4 amps; with button pushed and key down it draws 3.3 amps. I would like to do a factory reset but do not know how, can someone help me? I do have a service manual if PDF.

Sorry if this has been covered before I am new to the group.

Hi Roy,

Check around D104 on the IF UNIT for any sign of leakage... That is the #1 failure cause on TS-450s. If there is any sign of leaked cap, you need to remove C104 and also take out several components around, including IF filters, clean the area extensively AND redo some PCB vias there (all which seem darkened). It is a boring job but there is no shortcut to it. Even if that is not the cause for your problem, it is a MUST to do this work.

Regards,

JOSE

To do a reset, hold the A=B key and turn the radio on. You can also
hold in the A/B key and turn the radio on to reset all the programmed data.

To check the menu items hold in the LSB/USB key and turn the radio on.
The one thing you want to check is that the menu item 19 is not set to
on. That is transmit inhibit. It needs to be set to 'off' to enable
transmit. To change the settings, use the band up/down buttons. To go
through the menu items, rotate the m.ch/vfo ch knob.

After you check it, to get back into operating mode, just hit the 'clr'
.button. There is also another menu that you activate by holding the
'M in' key and turning the radio on. 73 and GL

good easter to list
you can paint it or sandblast and then find the hue of that color and the cosmetic part of the series kenwood ts-presents some defect in the years you should not rest on rubber feet because their mark especially when the equipment warms up, if you can find the same tint color let me know because I would try painting over again

Anyone placing an order with east coast transistor.

I am in need of part # s70-0439-15 tack switch. this is the power switch for a tm-d710, buit apparently is used in several other kenwoods.

It shows as only 2.40 (I think it was), but cost enormous to ship to Canada,

any one able to help. even a used couple of good ones.. or a complete, but dead, head from a d710..

I had one that did this. The S - Meter was pegged out as well. Looked like
RF Gain was maxed out.
I found a leaky cap on the IF Board (center of the board, I am unable to
remember the number). Replaced the cap and all was good.
I'll Google up some pictures later and try to read the cap number.

Subject: [TS-850_450_690] Part needed

Anyone placing an order with east coast transistor.
I am in need of part # s70-0439-15 tack switch. this is the power switch for a tm-d710, buit apparently is used in several other kenwoods.

It shows as only 2.40 (I think it was), but cost enormous to ship to Canada,
any one able to help. even a used couple of good ones.. or a complete, but dead, head from a d710..

Tom

Again thanks for the info.

Here is what i found when doing the reset. I could not reset the radio using the A=B or the A/B power on. I could however get into the function menus 1 & 2 and could make changes. In function menu 1 number 19 is off. I could get in to the adjustmen menu but could not make any changes. I will need to read some more because I could not find the click encoder switch. Also when I first brought ajustment menu i got a check sum of 892b. I have not found anything in the manual about the check sums. Did you have a place I can go to a list?

Tom

I just got around to do the reset of the TS450. I could not do a reset of the radio, I tried the A=B and the A/B at power on but no go. I was able to get in to the rest of the function and adjustment menus. 19 is set to off. In the adjustment menu I could not get to any of the ajustment screens. Function 1 & 2 menus I had no problem with I could make all the changes I wanted.

Again Thanks Tom for your help.

13175. TS-590S Power Cable - How To Get It Off ??

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-04-19 20:12:03 UTC
From: Mike Rhodes
Topic: 13175 Message: 13175

I know, dumb question but...

Trying to get the power cord off a friend's TS-590 so I can ship it. I didn't put the cable on so have no prior knowledge of it.

It looks like the 'loops' on the left and right sides of the connector are connected to the radio and are hooked over a couple small tabs on the cable connector itself. Is that correct. It looks like all I need to do is pry the loops off the connector. They are proving difficult to the point that I want to make sure I am doing the right thing rather than break something. Secure is good but these things seem ridiculous!

Thanks,
Mike / W8DN

If it's like a '570, push on the top rear of the connector while pulling it out of the connector on the rig. Pushing on the top rear should release the latch holding the connectors together.

I just got a TS-450S AT this morning. So far I'm still going through the manual and setting things up.

My antenna is a 280' square loop at 20' and, via an MFJ-949E, will tune from 80-6M with a 1.7 or better. The KW's built in antenna tuner (without the MFJ in line) works perfectly on every band except 20M. While tuning mid band on 20M, it shows a 1.5 and sits there for a few seconds then slowly climbs to ∞ then times out.

Any ideas?

Thanks,
Chad

What is the untuned SWR on 20? Most internal tuners struggle with mismatches much above 3:1.

It's not just SWR, sometimes auto tuners cannot tune due to the L anc C being too high. You can experiment with different feedline lengths. If you have some coax jumpers, try inserting it and see what happens. I remember one case that a guys auto tuner would not tune and we added 3 feet of coax and then it would! If that doesn't work, add longer pieces. A 280 foot antenna 20 feet off the ground will have some very crazy R, L, and C that the auto tuner cannot match. Changing lengths of feedline can change these values to something the auto tuner may be able to match.Give it a try and let us know.

...another thing to keep in mind, especially with your observation of increasing SWR with key down is that, even though the internal tuner MIGHT be able to make the match, that does not necessarily mean that it is going to be able to handle the mismatch. More than one internal tuner has met an untimely death matching at its limits. Tuners have inherent losses (typically about 20% under good circumstances I believe) so any time you push the tuner to its limits, you are going to make more heat and you know what that will eventually lead to. It will probably be easier and less expensive to repair or replace an external tuner as opposed to an internal tuner.

Mike / W8DN

On 5/5/2015 11:42 AM, Bob Naylor wotbob01@... [TS-850_450_690] wrote:

It's not just SWR, sometimes auto tuners cannot tune due to the L anc C being too high. You can experiment with different feedline lengths. If you have some coax jumpers, try inserting it and see what happens. I remember one case that a guys auto tuner would not tune and we added 3 feet of coax and then it would! If that doesn't work, add longer pieces. A 280 foot antenna 20 feet off the ground will have some very crazy R, L, and C that the auto tuner cannot match. Changing lengths of feedline can change these values to something the auto tuner may be able to match.

Give it a try and let us know.

Thanks bob!! I just got some new PL-259's (20 of 'em for $23 with the reducers) so I'll make up some cables this week and try a few different lengths.

Hello Chad,

First day had my ts-850 sat i was frightened it didn't work also.....
After an hour of panic i decided to turn up my carrier level... all
worked fine since then.
Logically, there has to be some rf power for tuning with.
The kenwood internal tuners are well known for their greater adjustment
range, so 1:2,5 must be easy to tune...
Does it tune in on other frequencies/bands? (on a resonant spot?)
Does it tune on a dummy load??
There was a thread long time ago with a internal tuner, after a long
time of searchin' a screw happened to be loose
on a shaft inside the tuner.... you could hear it tuning, but it
slipped, so it never came at the right position ...

B.t.w:
New PL-259's on the cable are allways a good investment/hihi!

Chad, I have two TS-450SATs, one of them tunes my antennas just fine on all spec'ed bands, the other one will not auto tune the same antennas on 20M, but I can switch the menu to manual tuning and get it to tune 20M below 1.5:1 SWR. If I then turn Auto-Tune on, the tuner goes searching in never-never-land. Go figure.

My 690 won’t tune 20m anymore.

Not even a dummy load.

It used to have trouble in the phone portion of the band and work ok on the CW end, but now it’s worse.

On the rare occasion when it tunes properly, it will work for a few minutes then suddenly jump to over 3:1.

Works fine on other bands.

I tried removing the Filter Unit and resoldering all of the 20m components, but no difference.

Maybe something is wearing out in these 20-year old rigs.

Ed, have you thought about swapping boards or tuners from one to the other to see if you can narrow it down?

Have any of you guys with the auto tuner problems put an antenna analyzer on and measure the problem areas? I for example can't get an auto tuner to tune my antenna that's resonant at 2.003 MHZ to tune/match down at 1.830 MHZ. When measuring it with an antenna analyzer it shows 3000+ reactance at 1.830. I don't remember for sure if it's capacitive or inductive but my common sense tells me it's capacitive. Anyway, the auto tuner will not match it at 1.830 but will at about 1.865 and up.
My point is the reactance is too high for an anto tuner to match when a manual tuner has no problems.
For those of you that use the MFJ antenna analyzers, pay attention to the instructions, which for my 259B it says the "resistance" is not accurate away from resonance which I believe because my little Autek shows a completely different resistance on my antenna at 1.830.
Mike, just my opinion, and I'm no expert, is that your tuner did match ok before but you may have been "on the edge" of it's range and a very small change put it out of range. Leaves growing on a tree that's within a 1/4 wave distance is enuff to do something like that. I'm not saying that's your problem, just something to think about.
Mike, W8DN brought up the point a day or two ago about auto tuners working at extremes.
Let us know what readings you guys are getting.

Mine does, too, depending on the antenna. I tried one antenna it didn't tune well on 160. This is probably strictly not "kosher" but it worked - I used an external antenna tuner to get the tuning close on 160 and then the internal TS-850 tuned it the rest of the way.

Subject: Re: [TS-850_450_690] TS-450S AT won't tune antenna on 20M

Have any of you guys with the auto tuner problems put an antenna analyzer on and measure the problem areas? I for example can't get an auto tuner to tune my antenna that's resonant at 2.003 MHZ to tune/match down at 1.830 MHZ. When measuring it with an antenna analyzer it shows 3000+ reactance at 1.830. I don't remember for sure if it's capacitive or inductive but my common sense tells me it's capacitive. Anyway, the auto tuner will not match it at 1.830 but will at about 1.865 and up.

My point is the reactance is too high for an anto tuner to match when a manual tuner has no problems.

For those of you that use the MFJ antenna analyzers, pay attention to the instructions, which for my 259B it says the "resistance" is not accurate away from resonance which I believe because my little Autek shows a completely different resistance on my antenna at 1.830.

Mike, just my opinion, and I'm no expert, is that your tuner did match ok before but you may have been "on the edge" of it's range and a very small change put it out of range. Leaves growing on a tree that's within a 1/4 wave distance is enuff to do something like that. I'm not saying that's your problem, just something to think about.

Mike, W8DN brought up the point a day or two ago about auto tuners working at extremes.

Let us know what readings you guys are getting.

Subject: RE: [TS-850_450_690] TS-450S AT won't tune antenna on 20M

My 690 won’t tune 20m anymore.

Not even a dummy load.

It used to have trouble in the phone portion of the band and work ok on the CW end, but now it’s worse.

On the rare occasion when it tunes properly, it will work for a few minutes then suddenly jump to over 3:1.

Works fine on other bands.

I tried removing the Filter Unit and resoldering all of the 20m components, but no difference.

Maybe something is wearing out in these 20-year old rigs.

Ed, have you thought about swapping boards or tuners from one to the other to see if you can narrow it down?

Subject: [TS-850_450_690] TS-450S AT won't tune antenna on 20M

Chad, I have two TS-450SATs, one of them tunes my antennas just fine on all spec'ed bands, the other one will not auto tune the same antennas on 20M, but I can switch the menu to

manual tuning and get it to tune 20M below 1.5:1 SWR. If I then turn Auto-Tune on, the tuner goes searching in never-never-land. Go figure.

Regards,
Ed

This seemed easier and less confusing than individual replies.

Joop - The 450 tunes on every other band (save 160 as the tuner doesn't work on 160) and tunes to a 1.5 or better. I haven't tried it into a dummy load yet. I'll try that this afternoon. The carrier is all the way up.

Mike - She might be 20 years old but she's been boxed up for the last 11. The guy I got it from (original owner) let his license go and just put it away. He was recently given a ton of equipment from an SK's family and sold it all in one lump. I asked if he had any HF gear left so he dug this out of his stuff for me. She's practically new. :D

Ed - When it starts to autotune on 20M, it brings it down around 1.5. If I immediately turn off the autotuner (hit #4), it's fine. Easy workaround?? LOL

Bob - I don't have an analyzer to throw on it. My buddy used his when we set the antenna up. It was a fairly close match on everything from 80-6M. When I used the MFJ-949E on my TS-520, I could get everything under a 1.8 easily.

Zack - The tuner in the 450S AT doesn't work on 160.

Thanks all!
Chad

Mine will hunt around and not find a match even with either of two 50-ohm dummy loads that I have,

so I've decided it must be the radio. My next suspect is the relays on the Filter Unit. I need to get

hold of a pair of replacements to check that.

13195. TS-850 Display board caps

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-05-08 12:38:45 UTC
From: kurt@...
Topic: 13195 Message: 13195

A few months ago the display went out on my TS-850. I cleaned up the board, replaced the caps, and rerouted past the damaged traces. All was then good.

A few days ago I started to have a new problem. The display is now slow to turn on. I was considering taking the radio apart again to see if I missed something. However, there is a new twist. It seems that the Mode and filters are also slow to turn on. When the radio first comes on and the display is blank, it seems that the radio is set in AM mode and has a wide filter selected. As soon as the display comes on it seems the radio now enables the SSB mode and the appropriate filter.

Any suggestions?

-Kurt

Hi All

If your tuner hunts around and cannot even tune a dummy load, check the germanium diodes on the auto ATU control board D1 and D2. I had one that was "leaky" on my TS-690. Replaced them with the new 1N60P schottky diodes and she is good as new.

HI,

After some troubles in the TRX command (Q152 & Q154) on the rf unit, in RX I have 8v on RXB but still 2v on TXB
=> no reception.

If I put TXB to the ground, reception come to life.

In TX, all is ok, TXB is 8v and RXB 0v

I also have changed all caps (47u & 10u) leaked on the car unit.

What happened on TXB ?? Where does the 2v come from ??

Thanks in advance for your help

13202. Kenwood TS-850S stuck in transmit mode

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-05-19 12:54:26 UTC
From: JF
Topic: 13202 Message: 13202

Hello all,

I'm a new member of this group, and am hoping someone here can help with this TS-850S problem:

Mine worked fine for years but had sat unused for several months with no power or antenna connected; then, when powered up again, it immediately locked into continuous transmit mode (like tune mode or keyed CW) and could not be made to go back to receive. The front panel xmit power and carrier controls function, and there is continuous RF carrier output power with every operation mode key even though the radio is not in tune mode and there is no CW key. Checked all front panel controls (including SEND & TUNE) & plugged/unplugged all cables and the CW key, but this made no difference, nor did a microprocessor reset. Frequency display & LEDs are normal, power supply is OK at 13.8 VDC.

A search turned up a comment on another list about a similar or identical problem, saying in that case on the BK Switch Unit pcb (BK SW, a very small board soldered onto the IF Unit), transistor Q3 shorted, thus locking the SS line low into SEND mode. With that clue I used a DVM to check all 11 pins of my BK SW board, and found these voltages:

pins 1 & 11 = ground
pins 2, 3, 5, 7 = 0 V
pin 4 = .012 V (SS line, low V puts radio into send mode?)
pin 8 = 5.14 V
pin 9 = 3.95 V
pin 10 = .021 V

I could not find an individual pcb connector for the SS line, but as it goes through the large CN3 ribbon connector I tried unplugging that, whereupon the radio returned to receive mode.

This may indicate a faulty SMD component on the BK SW board, but I'm not sure as I don't know the signal sources & functions on the other pins. I suppose it's possible that something else on the pins could be forcing the BK SW board into send mode. As this problem has happened to other owners, possibly there is a known design defect, or maybe some weak components got on the assembly line and affected only certain serial numbers.

I only have the short instruction manual and a PDF copy of the service manual, the latter being rather vague and hard to use for troubleshooting with limited descriptions, split blurry diagrams and connector designations that are not exactly the same as those printed on the boards.

Working on the radio myself might be difficult as I only have an analog scope & DVM, and don't have tools for SMD solder work (to say nothing of aging vision & dexterity). I'm wondering if sending the whole heavy radio off for repair might cost more than it's worth when shipping is figured in, so to begin I'd rather locate just a new/used BK SW board or a whole IF Unit to substitute. Or, is it possible to send only the IF Unit to someone who works on Kenwoods? Any recommendations for repair shops?

Suggestions will be much appreciated.

The TS-450S has no internal keyer, so an external keyer is required. I use a Picokeyer with my 450 and it works great. The Picokeyer kits are available from Ham Gadgets at a price of $29. If your friend doesn’t want to build a kit (very easy kit to build), there are plenty of keyers available on the market say on eBay or from MFJ.

Hope that helps.

Hi guys,
I purchased a TS-450S on Saturday and by this afternoon was wishing it had a CW filter. None were available locally so I removed the plug in 500Hz cw filter from my Yaesu FT-817 and soon had it stuck to the side of the ssb filter using double sided tape. I ran small tail wires from the filter pins over to the 450 filter plug pins and another wire to a nearby ground.
Flipped the rig right side up and did the programming to recognize the filter and away it went just perfectly.
Now to find some 8.83 filters at 2.1 or maybe 1.9 KHz wide.

I've given up on trying to fix mine, I replaced the C-104 cap that dumped it's guts, jumped a few corroded traces and it still has absolutely no audio. I may be able to fix it with a lot of effort, but I have no access to an o-scope and just want a working radio. If someone has a source for the IF board, I'd love to hear about it.

Thanks,

Sean KB1YOQ

Yeah, I've been watching. The boards were all over while I was trying to fix it, and then I finally decided to just buy one and nothing has cropped up other than a broken one with the same issue mine has. I was just hoping maybe someone here would have a pointer.

If anyone is parting out a TS-850, I need the u-shaped sheet metal cover that shields the rear half of the RF board on the bottom and the 4 screws that hold it in place. The shield is Ref. No. 96 in the TS-850 service manual parts list.

I just discovered that a TS-850 I bought a while back on eBay is missing this shield.

Thanks,
Alan, KD5R

Hi Jim,

I recommend the INRAD 2.1 KHz crystal filter (part No. 94) for the 8.83 MHz IF. I have that installed in my TS-450SAT and I am very happy with it. Not quite as narrow as the 1.8 KHz Kenwood filter, but with very steep skirts.

http://www.inrad.net/product.php?productid=211&cat=47&page=1

Hope that helps.

13221. 450 receives the same on LSB and USB

Yahoo group: TS-850_450_690 (2010 — 2016)

From: kc2mbv@...
Topic: 13221 Message: 13221

My 450 just started this odd behavior and I could use a little guidance, signals received on USB sound the same on LSB. It's like there's no difference between sidebands.

The only filter in the unit is the factory installed YK-88SN-1. C104 looks good and there's no evidence of leakage. I've reset the memory with A/B+Power on.

What's my next step?

Thanks,

Frank.

Try doing the power on reset with the buttons pushed but power OFF at the main power supply.
you will find that with the main power off there is a momentary light up on the readout as the capacitors discharge and then dead . Hold the buttons as usual and power on at the power supply.
This is what is called a HARD RESET.
My transmitter was totally locked out till I tried the HARD RESET. You would have sworn the finals were blown.
Sometimes when we push too many buttons the microprocessor gets confused and locks up.
Just switching the radio off and trying the reset sometimes doesn't work as the capacitive charge keeps the processor alive.
By doing the reset with the main power off you drain the capacitors.
As an alternative you can just let the set sit with all power off for a few hours.

Thanks for the suggestion but alas it made no difference.

I discovered another hint. When I switch the 8.83 filter to the 2.4 position it filters out the opposite sideband. Would this be indicative of a bad crystal filter?

Frank,

When you are hearing USB in the LSB mode, what position is the 455 filter in?

If you don’t have at least one of the 2.4 filters on, you’ll hear

you'll hear USB in LSB mode.

Sounds like your YK-88SN-1 is doing its job when it’s on.

Thanks for the reply Mike.

The 455 filter is set for 2.4K.

Let me rephrase the issue in case I didn't explain it correctly. The filters are the default settings of 6K and 2.4K. If I'm listening to a USB QSO on 20 meters, I can hear the QSO when I switch to LSB. Same for an LSB QSO on 40, I can hear it perfectly on USB.

When I set the 8.83 filter to 2.4K, the opposite sideband drops out leaving only the desired audio. I realize that's the quick fix but it's not supposed to behave this way.

I'm open for any suggestions.

Sounds like a failed switching diode in the filter line. The '450 I got in a trade had a similar problem, I got the diodes from somewhere in Florida. DAP36K maybe? It's been about 10 years, but I think I may have ordered a few spares if you figure out that's the problem. The service manual can be downloaded, but the schematics and board layouts are always difficult to read because of the image bleed through on the thin paper Kenwood used.

Stop the presses. I erred about C104. I found a small drop of clear liquid under the cap and I was able to break off a lead with minimal force. The underside of the cap was wet and corroded.

Now to clean up the mess, replace the cap and see if that was the problem to begin with.

Thanks to everyone for the input.

I removed CF1 and found gunk under it crossing a few lands on the board. After cleaning and resoldering everything I continuity tested everything and it looked good.

Upon powering on the radio a new issue developed, I get audio for a split second before the meter shows full scale and audio drops out completely. I thought this was a symptom of a bad C104. Did I miss a spot cleaning?

Then I noticed a new problem, the flex cable that connects CN7 on the IF board to CN4 on the digital board has leads that separated from the backing and they're not going into the connector. Can that also be a cause of the audio issue?

I can't find this part anywhere. Is there a suitable replacement? I see cables that are close but do not exactly match the specs.

Yes my TS-690S system has the same issue.

Replace ALL four of the caps, (220 uFd, 2x330uFd, and 10 uFd) in the AF circuit (IF board, all next to the AMP heat-sink).

BUT I found the 10 uFd cap (input) is intermittent and I have a new one to try. Seems all of them fail, poor part run I guess. replacing the 330's did NOT fix the audio, but freeze spray on the 10 uFd did cause the audio to get noisy and fade away... Heat gun brought it back. The 220 uFd is also suspect as it is the feed-back cap so it failing would have serious ramifications on audio too.

Sean KB1YOQ, try replacing the 10 uFd cap located in front (input) of the AF amp IC5 on the IF PCB...

$10.00 for parts & shipping ain't too bad...

ALSO, if anyone needs a copy of the FULL-SIZE TS-690S schematic, I can scan it in as a pdf and post it. (Doesn't show up in any of the Kenwood Manual pdf's).

From: daver@...
Topic: 13212 Message: 13235

CORRECTION: I should have waited till I got home with the schematic in front of me... (Memory not as good as it used to be...)

Audio amp chip IC5 = uPC2002v, C98=10uFd @ 16 vdc (input cap) , C99=330uFd @ 25 vdc (DC Filter), C101=470uFd @ 6.3 vdc (feed-back), and C104=470uFd @ 10 vdc (Output Cap).

I put two new 470 pFd @ 16 VDC (same physical size) in the place of C101 & C104.

Did not fix the problem just like you saw, HOWEVER, I lifted the audio input cable and the noise stopped, then (in my case) I found the 10 uFd cap (input) is leaky and noisy (changed noise level as it was heated/cooled) so I will change that next. I'll let you know how it goes this weekend, or you could just try changing it.

It is suggested to change all three on this website:

FIXED THE IF BOARD ON MY TS-690S! (Same as TS-450S)... Under the C104 the "+" side etch was corroded. Please see images...

C104 had leaked under the "55F", "55HT" and the "455 kHz" filters. I removed ALL of them and cleaned the stupid juice from underneath.

After reinstalling I had no more audio, (actually it was intermittent since I started).

I found the circuit was open from the IC5-4 to the "+" side of C104.

I thoroughly cleaned ALL the filters, replaced all the caps and installed this jumper, and SHAZAM! It works, AND my receive sensitivity has returned to normal!

Any one need the schematics for this section please email!

Topic: 13212 Message: 13243

Oops, I guess photos are a no-no...

FIXED THE IF BOARD ON MY TS-690S! (Same as TS-450S)... Under the C104 the "+" side etch was corroded. Please see images...

(audio_section.JPG in files section)

C104 had leaked under the "55F", "55HT" and the "455 kHz" filters. I removed ALL of them and cleaned the stupid juice from underneath.

After reinstalling I had no more audio, (actually it was intermittent since I started).

(corroded_etch.JPG in files section)
I found the circuit was open from the IC5-4 to the "+" side of C104.

(rework_wire.JPG in files section)
I thoroughly cleaned ALL the filters, replaced all the caps and installed this jumper, and SHAZAM! It works, AND my receive sensitivity has returned to normal!

Please email me if you want the schematic for the audio section for more clarity...

Hi Dave,

I kind of slacked following this thread. We arrived at the same troubleshooting steps, though!

C-98 in front of IC5 pin 1 was swapped, and I fixed the same bad trace (with a jumper) form IC5 pin 4 to C104 +. Unfortunately, in my troubleshooting I accidentally bridged a couple pins on IC5 with my multimeter probe and cooked it. I replaced it with a similar part, but while I get audio into the IC I don't seem to get anything but a constant voltage on the output side, pin 4. Guess it wasn't similar enough.

I found a broken board on eBay, happened to also have the same broken IC5 -> C104 trace. I replaced that and got audio back. Huzzah!

My victory was short lived, however. I get strong audio out now, but for some reason at the very least my tune button, the mic PTT button, and my S meter no longer work. I don't know if this is an existing problem with the borked board I bought, or if it is a cable I missed somewhere, or something entirely new again. Any idea? I'm hoping it's something simple.

I guess it would be easier to swap the ic5 to the board you fixed??? I can scan the schematic if you like... Did you check the filters cf1, 2 and 3 for oil from the defective cap? That could corrode a lot of stuff... Sent via my android phone David Reynolds

I haven't checked the filters yet. Should I desolder them to get underneath and clean?

I need to pull the current audio-working board and put the bad-audio board in an see if that fixes the button issue, I'm just not sure if that's a function that would be affected by the IF board or not.

Hi Sean,

Check the ribbon cable going from IF PCB to the front panel; on my system it was a B*TCH getting it back in the connector. Make sure it really is seated all the way. That is most of the front panel connections from the IF board… They did a great job of dressing the cables so the harnesses and connectors make sense where they should go.

After unsoldering the CF1, 2, 3 filters I discovered they are sealed on the bottom. IF YOU ARE BRAVE AND CAREFUL perhaps remove the board and drizzle some isopropyl alcohol and brush around them, blow-dry with a compressor/heat gun. They also are a real b*tch to get out without damaging the board/etches. The CF1 & 2 have a 5th (or 6th) pin that is on the opposite side of the row of pins. I almost broke one until I figured that little secret out…

Funny thing, I wrote Kenwood tech-support, asking if there were any other weak components for this vintage radio… His replay was “What weak components?” :/ Really dude? I sent you three links on this cap issue alone…

The good news is they still fix the 450S and 690S @ $75.00/hr labor +parts…

Okay, thanks, I'll check that out. I wonder if I damaged it somehow. Any idea if those ribbons are available somewhere if I did?

I've been warned by another TS450 owner that the section of trace or wire from the SO239 connector for the antenna to the board is weak and breaks often, and I've heard a lot about how I should replace the battery. One thing at a time, I think.

I found this page with a list of weak components:

I reseated that cable and I've gotten everything back except for my tune button. Pin 1 looks damaged on the ribbon, but not enough that it should matter - it's only the very very tip of the connector. This is labeled "FDA" in the circuit diagram - I have no idea what that means.

On the plus side, I can now TX, and the meters seem to be working. I just have to stay on bands that my ocf dipole is resonant on.

Does anyone know if pin 1 on CN7 on the IF board is for the antenna tuner? If not, any idea where that button is connected to?

What I see here, (which is likely what you see there), Digital PCB CN-4, Pin “1” goes to IC-6-11. The tuner is attached to the Digital board as well but through CN-9, which is attached to IC-1 (analog chip), and IC-7 (control?).

Now applying logic (pardon the pun), IF the tuner was working before the board swap, we can eliminate the DIGITAL PCB as suspect, so let’s look back at the IF board; IF PCB CN-7 pin “1” only goes two places on the IF board: IC3-13 [DA], and IC10-13 [DA]. I guess I would use a multi-meter and check continuity from DIGITAL PCB CN-4-1 to IF PCB IC-10 & IC-3 pin 13. If the connection is good than I believe one or both the TC9174F’s on the IF board are bad???

Perhaps swapping the IC5 audio chip into the otherwise known good IF board may be a better way to go at this point assuming nothing else was lost on the original IF board?

Hi folks,
At Field Day this year I noticed my TS-450 was only putting out 50 watts. It is the same across all bands and modes. Key her up and out comes 50 watts. It doesn't matter if the tuner is engaged or not and it seems to tune fine. I have the carrier/power/mic gain all cranked wide open. The power knob does run the output up and down, but it is 0-50 watts rather than going up to 100. I suspected one of the finals had burnt up or lifted off the board, but when I checked the look fine and appear to both be putting out rf. Should I suspect the drivers? Anyone here had similar symptoms? It's killing me that my baby is sick.

Most finals I've replaced were shorted so the main fuse would blow immediately. I suppose one of the two PA's (Push-pull) transistors could be defective (open?) but the output signal would be greatly distorted.

I think you should look at the output signal waveform on a spectrum analyzer or a station-monitor scope to ensure the finals are not distorting/splattering the band.

http://www.RFPARTS.COM/ would have the paired output parts should you need them. Merit is very knowledgeable in all things RF…

Good luck…

You may want to check the rectifiers while you are in there. Just in case.

I have a Kenwood PS-40 power supply that I use for my radio. During field day it exhibited a loud pop and quit working. I found that C29 had blown. That appears to be all that is damaged. Problem, I have a schematic but it is blurred and I can't read what size it is. C30 appears identical in the supply but no numbers on it.

Can anyone help?

It looks like on the schematic that C17, C29 & C32 are the same (at least on the fuzzy schematic I found.

It shows 2200 uFd and I would make sure I put in 35 VDC @ 70c. C17 & C29 are in parallel and C32 is in parallel AFTER the choke coil. Unless it shorted out, the supply should still output power although regulation, and noise would be increased…

As Tom suggested, the rectifiers on the switcher out should be checked.

Do the fans run? Does the supply “squeal”?

13275. Audio, mode and TX Problem with TS-690

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-07-22 09:58:13 UTC
From: nerminnadzakovic@...
Topic: 13275 Message: 13275

Good day to all. I am E74D, Nermin from Bosnia and Herzegovina, a newcomer here. Many thanks for You guys that You provide such a valuable help with the radios.

I have two radios. TS 850 and TS 690. few days ago my 690 gave me some problems. When I turned it on there was no audio on speaker and headphones also and there was no TX. Audio is OK only on AM/FM mode, loud and clear but on all other modes there is only weak trace of audio. So, CW, FSK, USB/LSB modes are audio deaf. Receiver seems to be working. S meter shows signals.

Also, when I try to transmit on CW or SSB modes there is no output power. (Did not try DIGI modes). Display shows blank area on S meter and red TX led is turned ON. No power at all is shown on display.

So, pretty worried now. I hope that You guys could give me some help with this issue. 73 de E74D

Topic: 13275 Message: 13276

Sorry to hear about your 690. Sounds like it might be the bad C104 capacitor problem on the IF board that most 450s and 690s suffer from as they age. Check the files section and search conversations for the numerous postings on this and your no transmit issue. Check the menu to ensure transmit hasn't been disabled and check the power board connector in the back to ensure connectivity. You can view the IF board through the bottom filter access panel. Good Luck.

Very nice working Kenwood TS-850SAT. Just back from AVVID Electronics were Clif went through the radio and replaced 11 caps and made sure everything is working fine. Already has the newer DDS chips installed.
Auto tuner works fine, 100 watts on all bands and is a 9 out of 10. Serial number 30800426. Includes the manual, and power cord. I received it with no mic. Smoke free environment. It will be triple boxed. $800.00 insured and shipped CONUS including Paypal fees.

Hi friends,

by some stupid constallation I shortly send 12W from my second gear
directly to TS-850 input.
Now TS-850 RX is cca 20dB attenuated but working OK. Reacting on
ATT/AIP. But "deaf".

Just asking for similar experience and what to check at first. Diodes
D93/D94/D3? Or?

Thanks for any feedback

12W directly in from an external rig? Much less than that, even in the milliwatts range, could damage parts. Other users have mentioned first checking a blown surge absorber it in regard to receiver overload:

> the surge absorber DSA301LA, located on the small pc board
> connected to the antenna connector, (remove top cover of filter
> unit, top of rig, rear-center, to get to it).

There are a couple photos of this small tubular device that were posted some years ago in this group by Bill Leahy K0ZL, at

groups.yahoo.com/neo/groups/TS-850_450_690/search/photos?query=surge%20absorber#zax/albums_304758952

Also, other parts could have been damaged by RF into the rcvr, some articles can be found via Google.

Hi John,

I will go through all input circuit at will see. It seems that 20dB attenuation is not band-dependent so I will try to go with XG2 signal generator step-by-step and also check voltage on diodes.

I tried to "google" some informations about similar problem but no success yet :-(

If anybody has some direct/indirect experience - please, let me know (on or of conferrence)

Thanks

13282. Intermittent Receive

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-07-28 01:41:42 UTC
From: n0ee@...
Topic: 13282 Message: 13282

My TS850S has intermittent receive. When it goes out, I can push in/out the REC/SEND switch and the receive usually comes back, I kinda have to "snap" it out. Is this indicative of a bad switch? I have read all about the transistor on the SW BK board, and other intermittent receive issues.

13283. Re: Intermittent Receive

Yahoo group: TS-850_450_690 (2010 — 2016)

From: n0ee@...
Topic: 13282 Message: 13283

I have just noticed when the receive drops out and comes back sometimes I hear what I think is a relay, so I'm leaning towards the transistor on the SW BK board or a bad solder joint, I have a switch on the way, a freeby from another ham. It works perfectly for days, no rhyme or reason as to when the issue comes about. Any ideas on how to proceed would be greatly appreciated.

If i understand, now your TS850 receiver is 20db lower than another reference receiver. If this is the case check Q49 (DTC124EK) on the RF board, it might be damaged. I had a similar issue and the AM detector diode was also blown.

From: ea1cxh@...
Topic: 13285 Message: 13285

Hi!
I have a problem with the ATU unit on my 850.
The tuner works on all the bands except on 80m. The SWR meter shows low SWR but the tuner dont stop tuning no matter what antenna is connected (Morgain dipole, 1/4 vertical, Windom).

My other 850 and 480 tuners works fine, but this one refuses to work on 80m.

Any help will be much appreciated.

Thank You very much Jerry for reply. I have replaced C104 once, maybe couple of month ago, but with a used one, did not had new one then. Lets hope that problem is the same and will be solved with a new capacitor.

By the way, one thing is also problem. Power on 28 MHz is only 60 W and on all other bands is more than a 100W, about 120W max. I have turned some trimmer resistor on board but got only small power improvement.

Any clue?

Well it seems like your 450 is transmitting again, that's good. As for the low power on 28 MHz I wouldn't know. I assume you are using a dummy load for testing and your 850 produces 100 w on ten meters with the same set-up in order to eliminate connection problems. I try to eliminate simple operator errors before I delve into a radio. Keep searching the conversations for posts with similar problems. That's what I usually do.

Topic: 13294 Message: 13294

Hi all,

I have a problem with the monitoring.

I changed IC7 on the IF unit but monitoring is still out.

I got the same results with the old and new IC7

I have 3.77v on pin3,5,6,7 but not on pin2 (pin2 0v)

On pin 8 I have 7.55v
On pin1 I have +/- 6v for few seconds then down to 0v

Signal input from CN16 is ok.
The monitor muting is ok
Signal from CN16 is ok on C172 - Pin2 (+/- 40mv PP)

I removed C172 and still can not get 3.77v on pin2

If anyone could help me, the circuit diagram of the IF Unit is on page 154 (moni pre amp IC7)

Any help should be appreciated pse.

Thanks in advance

It is possible however if the rig is keyed via the communication port, the front panel mic line stays active and you'll have to unplug it to stop the room noise from going out.

If you want to use ACC2 I suggest you key the rig from ACC2 also. (This is my experience using a 450.)

I also suggest a second sound card in the PC to prevent your Windows sounds from being transmitted. (Assuming you're using a Windows PC.)

Hi Guys,
recently i have acquired TS-850SAT for the third time:)
Have had changed 2nd.IF filter into YK88S2. Now the Murata
filter CFJ455K12 (3rd.IF) is original one in TS-850S.

In TS-930S i have YK-88S2 and Murata CFJ455K13.

When comparing both service manuals TS930S/TS850S(characteristcs)
of built in CFJ filters, apparently no difference....
Could not find those differencis on the WEB either ??...

Thus, why the different markings for the same characteristics of CFJ filters??

Thanks,

Nermin S58DX

Here is the update.

As said many times before on forums, I replaced C104 and cleaned all the traces and thru-holes on PCB, that was impacted from leaking C104. I removed all 3 filters and cleaned under them also. I checked for continuity for all the elements close to the C104 and everything seems OK. Yet, radio is still doing the same. No TX and no audio on except on AM mode, where the audio is normal and strong. VE1IC wrote on forum on other similar problem that reason could be some PIN diode and IF amplifier near filter but I dont know where exactly are those elements.

I am stuck now! Does anyone here have some time and will to help. Thanks. 73 de E74D

Hi Jerry

I have not been following your post but on a quick look I saw that you are having trouble with the famous C104, like I did.

On my case the TS450 C104 leakage was new when detected back then to cause much damage I guess.

I remember back them (years ago) I replaced the cap and cleaning up the board with contact cleaner spray which didn´t help at the time. The radio still had no audio and the ALC meter went crazy.

I was too busy back them to try something thing else to make it work and then I put the radio back in the closet...

Several years later I decided to try my TS450 again (couple weeks ago)..and voilá...it was fixed! I believe the contact cleaner left something humid back then that prevented the radio to function properly and now it is all dried and it is working.

But the reason for this email is to point you to couple videos from one of the best technicians here in Brazil.

He posts videos on the YouTube showing all his works and there are couple videos about this same problem C104.

And since you are doing everything by yourself, try it out and see his work...He speaks portuguese during the videos. Now days he does not repair TS450 line anymore due to the radio age (no parts, I´ve heard) but you can get some ideas about his work...

I was going to try something else on my TS450 based on his videos, before taking my radio out of the closet, but since it fixed itself, I´m lucky!!

https://www.youtube.com/watch?v=NR9hHZaW4Vw

https://www.youtube.com/watch?v=gjCLq-5-CKw

Let me know if you need any help

Sorry for my poor english.

Topic: 13307 Message: 13309

We're getting a bit off topic, but from the amplifier's manual:

"The only danger presented by a high SWR in this amplifier is that the current and power dissipation in the output devices may exceed safe limits. Lengthy operation with high SWR at high power levels can result in heat damage and failure of the FET devices. If the reflected power exceeds 50 watts the power level should be reduced until the reflected power indicated on the internal meter is 50 watts or less on peaks. At approximately 75 watts of reflected power the internal safety circuitry will disable the amplifier."

This doesn't look like a problem with the transceiver, but rather with your load. You need a tuner to bring down that SWR. This can be especially important when running higher power, a load that a barefoot rig can tolerate may fry an amplifier.

No. I'm believing the tuner is not working at all. The relays don't kick on when you but the tune button. Guess I need to join another yahoo group for that issue

Subject:Re: [TS-850_450_690] linear/external tuner

I am no expert, but I would suspect the amp does NOT like the 2:1 swr. can the tuner not bring that down, and is it on the antenna side of the amp???

Try putting a manual tuner in line, instead of the ltg, tune to get lowest (less tan 2:1) swr and give the amp a try. That should confirm if it is the tuner or amp. Some auto tuners just may be happy with an swr of 2:1, you never know. I think that "acceptable value" may be adjustable.
Just a thought
Let u know how things work out

Make sure the tuner is the radio is turned off / like you say " pass through "
Then make sure the LDG is between the amp and the antenna .
I think the LDG can work a couple different ways , using a LDG cable to tuner from radio and then on lowest power on radio and amp in bypass , key up radio - if the LDG is set up correctly , keying up the radio will get the tuner to tune if needed [there is a option in the LDG menu to have a preset SWR limits , both high & low .
You can also do a manual tune , by hitting the tune button on the LDG .

13313. rf board picture needed..

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-08-29 20:30:12 UTC
From: ve3wej@...
Topic: 13313 Message: 13313

Can someone please give me, if they have it, a LARGE image of the backside(solderside) or the rf board number x44-3120-00. specifically the area behind the 2 attenuator relays, trying to verify where r1 is, A 51 ohm resistor), but I think mine is actually a 470k ohm, which would explain why it is not working correctly.

also the aip board mount image would be good too.

ve3wej@rac.ca should work

Kenwood TS-850_450_690Hi Dave,

you are lucky

i have rf board out and also original service manual for
TS-850S. R1 is on foil side of rf board bellow relay K1,
cca 40 mm vertical from edge of foil.
Also, look for pins of relay K1.
In the upper portion of relay there are 4 pins. R1 is between
them almost in the middle. And as said Diode D1 is on the coil
of K1 and horizontal to pins and R1..

As i am going out,now, let me scan the portion of rf board in
question and i will send it to you.

In nutshell R1 is vertical to the horizontal placement of diode D1...
Copies of service manuals are crap, but nevertheless look for shaded
rectangular area of K1 which is vertical on relay K2...

Hope it helps,

Kr Nermin S58DX

A close up would help/ I tyhink I am looking at the right location, but mine is labelled 450, not 51, and measures 450k with a meter across the leads, not removed.

Don’t need the aip layout now, replace pins with short wire lead to board. Other than that 6db issue with that 51 ohm resistor, all is good

13319. TS 450 SAT hum on all bands

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-09-11 00:05:35 UTC
From: handy4563@...
Topic: 13319 Message: 13319

My TS 450 has a high pitched hum on all bands and all frequencies even AM broadcast. I pickup stations talking or am broadcast OK, but the hum is there steady all the time. Also adjusting AF and RF does not change the hum. Disconnecting the antenna does not change the hum either. My old Swan 350 does not have this in the audio using same antenna. Some ideas what to look for? I have not used this TS 450 for a few years.
Thanks,
Jim KB7OCN

sounds very much like you have filter caps going
out of the power supply.. try another supply or
direct to 12vdc battery if it goes away you will
need to replace the filter caps in the supply..
go ahead and replace all of them and save yourself problems down the road.
hope this is of help

Jim,

Do you have another power supply you can try? Also does it have hum when you insert headphones? I would suspect the power supply first.

When you say adjusting the AR or RF will not change the hum, do you mean it doesn't change the tone of it or the volume level of it? If it's from your external power supply, these controls will effect the volume level.Please clarify.Bob WE6C

Subject: [TS-850_450_690] TS 450 SAT hum on all bands

My TS 450 has a high pitched hum on all bands and all frequencies even AM broadcast. I pickup stations talking or am broadcast OK, but the hum is there steady all the time. Also adjusting AF and RF does not change the hum. Disconnecting the antenna does not change the hum either. My old Swan 350 does not have this in the audio using same antenna. Some ideas what to look for? I have not used this TS 450 for a few years.
Thanks,
Jim KB7OCN

everyone agrees, seems to be power supply. do you have a substitute to
use, borrow, or a car battery to try?? if hum goes away, then

power supply..

Adjusting the AF or RF does not change the audo or tone of the hum. I ran it on just the battery, disconnected the battery charger still have the hum. Connected it to my power supply as I have it on battery all the time. Still have the same hum. I think will open it up and disconnect the speaker and see if it goes away.

My TS 850's frequency is correct on all ham bands, but I noticed that it was about 3 khz below when I listened to AM broad casting station. I checked WWV 10MHz and found it ok. Any body has same problem as I have.

I finally found what the hum was. I thank all of you for your replies. What I found is the hum sounded like the side tone for cw. That is what it turned out to be. I have a 493 MFJ keyer and a straight key hooked to the Kenwood 450. The wire from the keyer to the kenwood had got smashed and had shorted from shield to center conductor. So was making the side tone noise all the time. Had I pressed the send button it would have transmitted and would have known right then but because the wire antenna was down I did not want to transmit. Like I said before I had not used the radio for several years and now that I am retired I wanted to get back on HF again. Sorry for posting before I checked, but all I could think was defective radio.
Thanks,
-Jim

13334. Question about FSK

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-09-22 09:21:21 UTC
From: Ervin Hegedüs
Topic: 13334 Message: 13334

Hi there,

I'm interested for FSK mode with my TS-850. A few months ago I've build an FSK modem for my TRX with an Arduino. Arduino gets the messages through USB (serial), and with an optocouple, it generates the modulation for TRX. Everything works as well, but now I'ld like to look behind things.

My problem is, sometimes few stations warnings me, that I'm working in reverse mode. So, I don't know, when do need I switch to reverse mode from normal. The real question is, if I switched my TS-850 to FSK, then it always works in USB or LSB? What I mean (hope this ascii art will go through):

```
|
| | <- start
| |
| |
| |
| |
| |
| | <- 2x stop
| |
|
+-----------|--------------|---|----------> freq
carrier space mark
```

This site describe the FSK mode:
http://www.dxing.com/modesand.htm
"The higher frequency is called the mark frequency while the lower of the two frequencies is called the space frequency."

The ascii image above shows, that this is the "upper-side-band". Most RTTY documentation follows this idea. Based on this image, the "LSB" looks like this:

```
|
| | <- start
| |
| |
| |
| |
| |
| | <- 2x stop
| |
|
+----------------|---|-------------|------> freq
```

space mark carrier

I'ld like to ask you, is my theory right, or em I wrong in something? And of course, should I switch between reverse and normal mode, when I change the band (eg from 20m to 40m), or not?

Any helps are welcome,

73, Ervin

This is AFSK (Audio Frequency Shift Keying), not FSK (which is direct Frequency Shift Keying, not using a modem).

If you are able to copy other stations but are not sending correctly, your modem has incorrect polarity while sending. It will work equally badly in both LSB or USB, since transmissions will be inverted compared to reception either way. You need an inverter before your modulator, and the problem should go away.

Use the appropriate sideband on each band - if you can copy the signals that you hear, you are set up correctly. However, add an inverter in your transmit chain and you should be OK.

- Richard, VE7CVS

Hi Richard,

thanks for your answer,

no, this isn't AFSK, this is FSK. I'm using a "keying" modem, not a soundcard modem. Arduino reads the message through its USB (serial) port, as ASCII text, and a software change the state of digitalpin 3 or 4 - as you want. That controls an opto couple, which controls the TS850 FSK input.

I've made about 5-600 RTTY QSO with this circuit, and of course, I can copy the signals - after I switched to a right polarization in both side: TX and RX.

But I would like to understand the _real_ operation of RTTY _WITH_ FSK.

Hi, Ervin:

I should have noticed the 'optocoupler' bit - modem is a contraction of modulator/demodulator, and implies conversion to and from audio. Your Arduino is keying the FSK shift line, rather than modulating audio, my brain latched onto 'modem' rather than following the rest of the text.

This option came in my rig , but do not use it .
I would suggest setting the mike gain & processor to correct settings .
Then I would guess that the monitor setting would be what you use to bring
the volume up to what you prefer .

Audio reports are good... Have 2-3 different mics also all are fine.... Read elsewhere that it is more than likely the DDS chips on the CAR board going bad... Guess that will be the next thing to address...

Yes, I am using the MONI button to listen but it is very, very light. Have to literally put you ear to the speaker to hear it. Someone was saying that each of the DDS chips controlled different things and one controlled the MCAR (I thing) that would make the audio distorted and/or weak..
thanks again for the responses

13362. Distored monitor sound in headphone, CW mode

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-10-13 09:00:24 UTC
From: Ervin Hegedüs
Topic: 13362 Message: 13362

Hi all,

a few days ago, a new symptom came out: when I work in CW, and TRX is in TX mode, I hear my signals in my headphone - but sometimes it's very distored. Just few signals, not a permanent state, but that's very annoying. I can work without it dew minutes, then the distored signals comes, for few seconds. I'm call few CQ, and these signals goes away again...

It doesn't depend anything: I've tried to reduce my RF power, switch IF filter, tune AT, tune shift/width, turn on/off the input divider (6db, 12db), ... - nothing, the symptom is persist.

But only I hear that in my headphone - when I plug it out, I don't hear it from the built-in speaker.

I could't check it in SSB mode, or RTTY yet.

Has anybody an idea, what would be this?

I am not sure if the 450 has the same issue as the 850, but is the wattage dropping, while the alc jumps up. the 850 had issues with the "carrier" board. are you using the hand mike,

Hi,

i do own a TS690S. After 10 years without using it i have switched it on again. First thing that showed up was no audio because of the leaking C104. I changed C104 together with C101 and C99. Audio is back again.

The Rig works nice again, but i do observe a constant noise at a level about S1, even without an antenna connected. Is this normal behaviour? What could be the source of this?

Thanks in advance,
Karsten

I have to correct myself.

Changing the capacitors brought back audio, but after a while switched on, the audio becomes scratchy and the sensitivity of the receiver goes down. I do hear stations, but the S-Meter shows lower levels than directly after switch on.

Any sugestions?

Thanks in Advance
Karsten

Thank you for the hint.

when poking with my finger at CF3 (the Murata 455k Filter) there was a scratchy noise from the speaker and the noise level changed. So i desoldered CF1 CF2 CF3 an L1 to see whats under them.

There was, however, a lot of spillout from C104. I cleaned the parts and the board from both sides. But i do have one problem now. L1 lost two of its pins while desoldering it. It sits in the schematic of the IF Unit (1/2) in the upper left corner between the IF AMP and the crystal filters.

It has "3421 2105" printed on it. The ferite core is painted yelow.

Still using myTS-450 sat (I am the original owner) since Feb. 1993. Have installed various IF filters (1.8 Kz ssb, 500 hz cw, and 270 hz cw) over the years. Recently picked up a TCXO S0-2 but have not installed it yet.
No amp. G5RV at 30".

Am wondering: am I one of the very few still using the 450/690/850 as the primary (in my case only) HF rig (mostly daily - usb and cw)?

The TS-450SAT is my main rig. Ihave 2 of them here.

I'm using it right now in the CQWW SSB DX contest. Working all sorts of DX on 10, 15 and 20.

It is still a great rig. 73

I got my ticket about 2 years ago. I thoroughly researched the primary features of a typical HF rig, features like IF vs AF shift, high/low cut filters, notch, etc and found that for the money, a used TS-850SAT was probably the very best value out there for the discriminating user. Not a contester necessarily, but someone who wants a lot of capability for general DXing, rag chewing and the like.

I found a high 6mil s/n rig in like new condition for $650 to my door and it has been my daily driver ever since and I have had absolutely no desire to upgrade. I'm an equipment junkie too. I love getting new toys to play with all the time. I picked up a couple DX-70 Alincos to tinker on. One was resold and the other is my mobile HF. I picked up an FT-857D a few weeks ago for backpacking and SOTA, and I just found a project TS-520S for $60 the other day (talked into Finland on it just this morning). NONE of these other rigs was intended to become my main rig obviously but they each serve their purpose.

I LOVE my 850 and will probably never let it go. It will probably be my daily driver until it breaks and costs more to fix than what I could buy a brand new rig for. At the price of new rigs, I could probably buy another two working 850s to keep as spares.

I have 450 and 690 each with full compliment of Kenwood filters, one for SSB and two for CW as I recall. I use the 690 as my primary radio in FL. I have two TS-850s, two TS-870s and one TS-590. They are all great radios but the 590 pulls out weak CW signals that the others can't. I swap out the 450 with the 850 and 870 just to exercise them while retaining the 590 as primary to catch any DX. The 450 is really a very neat radio and performs very well. Honestly, I could probably get away with using it as my primary if need be. I have had to send all of them at least once over the years to Clif at Avvid for various repairs, typically capacitor replacement.

Rick,

TS-450SAT is my primary rig!

I am the second owner of my TS-450SAT (older rig now in box is TS-430). Have it since 2012. All filters, voice thingie plus the TCXO.

Worked all over the world with an End Fed 72' wire up 35'.

I placed in all frequencies of the ARRL Frequency Measuring Test in April 2015.

It is hooked up to HRD and RigBlaster Advantage and Windows 7 computer.

No reason the buy those "fancy do-dads" with all he buttons and displays. (Even though I have two other rigs with DSP and Spectrum Displays.)

If it ain't broke don't fix it!

Enjoy your rig!

I have decided to sell my complete TS 850 SAT.
Before I post this station elsewhere thought I would give the group first shot
I will post a photo in the photo section

This station consists of the following:

TS 850SAT S/N 401_____
DSP 100
PS-52
SP-31

I will not separate this station it will be sold complete.
I believe I still have a TS 850 box, not sure on the others boxes

I would like US$1,200 including shipping in the 48 US states

email me W3PA@aol.com

Chris, I agree with you about the 850. I've had mine since something like 1996 and have no desire to replace it. I would though for a 990 but not ready to spend eight grand on a radio!
I have another ham friend that has the Elecraft K3 which the world seems to love, and an 850. He says the receive on both rigs are "comparable" The 850 is a very fine rig and for people that have never owned one, have no idea how good they are.
The argument some have is no DSP. I personally do not like DSP so that's not an issue for me. Between three filter slots filled, AIP, Slope, RF gain, and three choices of attenuators, I'm happy. One problem with owning an 850 is that only very high end rigs would satisfy you after owning an 850!
One thing I did was about three years ago I sent the 850 to Clif Avvid for a "check up" I told him I had it for about 20 years and would like it to last another 20 years so he gave it some preventive maint etc. There was nothing wrong with it and I wanted it to stay that way. BTW there's (knock on wood) never been any problem with it whatsoever since I've had it. I bought it from a friend that bought it new so I knew it's history. He sold it to me cuzz he wanted an 870. When he bought the 850 new I fell in love with it right from the get-go so when he wanted to sell it to me I was thrilled!
I do a lot of CW but I also use phone a lot. A guy recently told me, with only the stock hand-mic, "the audio is great so don't change anything!" Can't beat that for an audio report!
Enjoy! 73, Bob WE6C

Hi Dave,

so, the problem is still exists - I've changed the headphone, but the monitor signals are also distored. But now, if I pulled out the headphone, the built-in speaker gives distorsed signals too. The connector is an 6.3mm jack, my headphones have 3.5, so I need a transformer. If only the transformer is plugged in, without headphone, then comes the distorsed signals.

Looks like the headphone wire works as antenna, and collects the RF - but how attached back this RF signal through the headphone wire?

And one important thing: when I'm keying (with PC or "classic" extarnal el-key), then there is a new noise from RIG: it looks like a relay or switch, eg. the PTT switch inside, and it switch as very faster, like the PTT delay is low, and the operator works fast.

Any idea?

Hello Ervin,

Is it possible you are getting Rf back into your radio shack and the Rf is being picked up by your headphone cable? This can happen with many types of antennas-G5RV, Off-center Fed Dipole, shortened verticals, etc. on some bands. I have had it happen with my OCF dipole and the radio would give me strange sounds and shut off at higher power. You could check it if you have a dummy antenna-it should not happen, or you can see if it still happens on different bands. If you suspect you are getting Rf back into the shack, a cure is to insert an Rf choke into the transmission line.

I hope you can track down and cure this annoying problem.

Hi Scott,

I don't know - but as I wrote in my last e-mail, when I unplug the headphone, and there isn't any 3.5/6.3 converter in headphone output, then the built-in speaker is also distored. In that case, there isn't headphone cable.

Today, I've played with RIG, and tried to detect the issue. I've turned on the RIG, and about in the first 10-15 minutes, there wasn't this effect. I've worked on 20m. Then the distored signal has arrived (after the 10-15 minutes). I've changed the band to 40m, distored voice also there.

Then I've tried to change the stay of potentiometers on front of RIG: I've

modified carrier (CAR), when I turn it to low, and power stays as 100W's out, the distored voice has left. I've checked the ALC level, the built-in instrument measures 0 of ALC level... I've turned up, distored voice came back. Then I turned back to "normal" level of ALC, and started to modify the others: MIC, PROC and MONI. I didn't found the exact cause, my opinion is the MIC potentiometer occured this issue: I turn to low, and back, then distored signals had left, and no came back. I don't understand that, because usually I'm working on CW, sometimes in FSK - the microphone is in the cupboard. I don't see the connection between distored CW monitor signal, and MIC potentiometer. But may be, I just missed out, and the another level controller was the causer.

Anyway, I've a 4 band GP (40-20-15-10 meters), and a dipol (80m), so I don't have any antennas, which your listed here.

Today evening (here, in HA) I've made abt 70 QSO's, but the distored monitor voice just came once, for a very short time (1-2 seconds).

Could be the reason is a wrong potentiometer one of the fron panel?

Thanks,

73, Ervin

13389. Configuring TS-850 with external auto tuner (MFJ 998)

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-10-28 05:02:39 UTC
From: zclobes@...
Topic: 13389 Message: 13389

I picked up an MFJ 998 with the Kenwood interface cable. I flipped the slide switch on the back to indicate external tuner. Also, I configured the 998 to interface with a Kenwood.

When I press the Tune button on the 850, the tuner recognizes that it should be tuning, but the 850 never switches into transmit mode. It just sits there in receive, and the tuner eventually gives up telling me to increase the power.

I see references to changing some menu settings, and I've played with a few of them, but beyond that, I'm not sure where to look.

I have to 450's with ant tuners they both put out a 100w when the ant tuner is off. When i turn it on and tune it to 1:1 my swr meter says depending on band 55-75 watt output turn it of i get 100w again. it does it on both radios is this norm tried different swr meters still the same. Why does it do this

Have you checked this with different watt meters?

If your SWR is high, it will show more power out on the watt meter, but
that is a false reading.. What does the meter on the radio show? Is it at
100 watts there? 73

Try putting a dummy load on, and using the tuner to match the dummy load. That will tell you how much is getting lost in the tuner because of switching relays, loss in components etc.

From: zclobes@...
Topic: 13389 Message: 13396

After further investigation it turns out that the MFJ-998 had a problem. The TS line from the ACC jack goes low which tells the tuner to do its thing, and in return the tuner is supposed to bring the TT line low. The TT line causes the 850/450 to start transmitting until the line is pulled back up.

In my case, the '998 wasn't driving TT low, but if I shunted across TS to TT with a 1k resistor, the rig would transmit a carrier as expected.

13397. attenuator issue solved

Hi gang, just a note to thanks those that advised, supplied pictures, etc. I finally got the nerve to check (again) the 51 ohms resistor in the att circuit, to confirm 51 ohms, and found 450k. removed and replace with a physically larger, but correct value 51 ohm, and now the 6 db attenuator works..

the ts850 is now 100%, instead of the 99% it was doing

When you push it in, it brings up a scale at the bottom of the S-meter.
That is the signal level in dB. 73

Alan,
You're inquiring about the TS-450/690's RX Meter function. The RX Meter is turned on and off with the "RX M" or #3 button. Per the manual: "When this key is pressed during reception, the dB display turns on and off. The AF level is displayed on the scale (dB), independent of the AF volume control setting." It's actually one of my favorite and most useful features of these rigs. Here is a copy of a post I made to this list back in 2013 on the topic:

One of the best features of the TS-450/690 that you don't find in other rigs (even it's big brother the TS-850 and subsequent rigs) is the RX Meter. In my informal polling on the air and online, most operators using the TS-450/690 don't understand or don't use this powerful feature. Most may have it engaged, looking at the bar graph LEDs flicker away reflecting received audio level, but do nothing more.

The power of this feature shines when used in combination with the RF Gain adjustment. Once a desired signal is tuned in with desired filtering, with the RX Meter active, back off the RF Gain until the peaks of the receive signal on the RX Meter bar graph just start to come off the 0 dB point. This is that magical sweet spot point where AGC is not backing off the desired signal, resulting in maximum signal to noise. Back off RF Gain further and you start to reduce the desired signal. Back off RF Gain less from this point and you increase noise and AGC starts to cut back the desired signal.

It really is a powerful feature that I wish was incorporated into other rigs. In fact I don't know of another rig that has it. Anyone know of one? I don't know if Kenwood has incorporated it into its latest rigs (TS-590 / TS-990). Perhaps someone could tell me that. If they did, I'd be inclined to relegate my TS-690 to backup rig status and upgrade.

I also like to turn on the peak-hold feature that the RX, TX and S-meters have. It's turned on and off via the LSB/USB Power-on Menu, #08 (Section 4.11-15 of the operating manual).

Hope this information help.

I had been wanting to buy a Kenwood hybrid to restore for quite a while and I recently found a nice candidate for the right price, a $60 TS-520S. I got it home and discovered that is works perfectly, 100+ watts out on each band and I have been working the world with it for about two months now. Best contact so far is S. Africa, about 9800 miles.

Anyway, I have found the time (I think) to begin the restoration so I started gathering what I need to complete it. I ordered the screws and plastic fasteners for the side door and they should be here next week. The rig is in really rough cosmetic condition with a fair amount of corrosion everywhere. The cover panels and the supporting sub-structure needs attention.

I took the side cover in to Lowe's the other day and had them try to match the paint for me. I got a half pint for $3.50 and it is a PERFECT match, right down to the gloss! I'm stoked to get this thing done now because I really didn't think I would ever be able to get a good original looking paint.

Anyway, I just wanted to share my excitement about the project.

For Sale: my Icom IC-7600
Includes:

IC-7600 transceiver
Original Box
Hand Microphone
Power Cord
Original Physical Manual and CD-ROM manual

Price: $1,915

For sale: Flex Radio 6300 with ATU and Handle Kit installed.

The radio is in like new condition. No dings, scrapes, or dents in a non-smoking environment. It comes with all the original accessories, microphone, and power cord as well as Quick Start Guide and CD.
Will be shipped in original box.
Price: $1,900

ICOM IC-7000 in very good condition.
I am including the original hand mic, a desk mic,
original box , power cable , manual, remote kit,
mobile mounting bracket and a NooElec USB SDR I have been using as a panadaptor for this rig.
Price: $750

I have just bought a TS-850s and it does not have any of thew optional filters. I believe there are three that can be put in. Can anyone give a recommendation as to what would be the best set up. I appreciate anyones thoughts on this.

I have owned TS-850S, TS-450S/AT, TS-690 and TS-440 in the past and have come to appreciate extra value in the INRAD line of filters. The Inrad filters generally have a better shape factor (sharper skirts) than the Kenwood filters.

I especially have liked the Inrad 400 Hz filter for RTTY. The 2100 Hz filter for a real difference maker on SSB that I like better than the Kenwood 1800 Hz filter which degrades audio to my ear.

You may find any of these filters for sale on Ebay, QTH.com, QRZ.com or through many reputable dealers.

Enjoy your new rig. :-)

Mel, I agree with you on the 1800. I had once once and it seemed to screw up the audio more than it "narrowed" I'm not a phone contester anyway.

Did I hear correctly that to install the INRAD filters you need to cut the pins shorter?

My thoughts!
Save your money and use the Slope Tune. The Slope Tune works great on side band. You will need to practice at it a little.
For CW, most operators prefer the .500 on the 455. Most say that the .250 is a little too tight. Best Regards

I have a couple of TS-450's here and find the Inrad filters work the best.
I use a 250 cycle filter for CW. Don't operate all that much SSB here so
just use the stock filter for that.

Inrad is at https://www.inrad.net/home.php?cat=56

Not associated with the company, just a satisfied customer. 73

I agree with Mel. I equipped my TS850SAT with the optional YK88SN-1 (8830 KHz, 1.8KHz) and YG-455CN-1 (455 KHz, 250 Hz) filters. While they help during crowded band conditions, I will replace them with better InRad filters as I get a round tuit.

Also, I highly recommend the InRad roofing filter. At $200 each, they're not cheap but, when you look at the width AND shape, they're excellent. My unscientific before-and-after tests showed that it makes a HUGE difference when trying to copy a weak signal that is close to a very strong signal. (take a look at the image showing both filters: http://tinyurl.com/wa7prc-roofingfilter). Blocking is GREATLY reduced.

InRad filters for the TS850 can be found here: http://www.inrad.net/home.php?cat=56. Compare those to the list I assembled that shows the bandwidth (at -6 and -60 dB) of most Kenwood filters. See http://tinyurl.com/wa7prc-kenwoodfilters.

Topic: 13414 Message: 13427

Hi Guys,

have had three TS-850S so far Couple of TS-930S, TS-950S/SD/SDX

All of them were equiped with original Kenwood filtes
of YG and YK series...

My biggiest dissapointment was with TS-930S filled up with INRAD filters and in late 90’s TS-850S also with INRAD..

From operator’s point of view, they have too much attenuation and are bulky to install, to put it mildly...

My present TS-850SAT of 5series has following...

-Main filter YK-88S1 replaced with TS-930S/870S/ filter YK-88S2 of 3.0 Khz...It does perfectly match and sounds
coupled with Murata CFJ 455 K13 in third IF...

-SSB filter YK-88SN-1, 1.8 Khz bandwith for tough pileups

-Cw filters are : YK-88C1 and YG-455C1 in 2nd and 3rd IF

-No roofing filters....

-Outboard filtering is done with Timewave 9+

-Has also DRU-2, and TCXO of Chinese origin

So, my definitive advice is go with Kenwood filters, go with matched bandwiths and buy an outboard DSP if you need it...

For comparison purpose i have TS-590S and marvel of radio Kenwood TS-830S, with main filter replaced YK88S2 and
matching TRio/Kenwood filters YK-88C and YG-455C...

My previous radio TS-930SAT was also (and still is) equiped with original Kenwood filters of YK and YG origin being 500 Hz....

So do not waste money or time with replacements...
If you want to really compare the filters you need a modest lab or friend who has one....
Attenuation in filters and signal delay are serious matter, thus i stayed with original crystal filters...

All the radios are coupled to pair of Behringer Monitor 1C...

The best sound comes from TS-830S....

And yes, the TS-830S is masterpiece of engineering and easy of use...

Kr Nermin S58DX

13428. Station Monitor SM-230

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2015-12-12 16:07:39 UTC
From: spagnel@...

I am new to ham radio and have bought a very nice TS-850S, one thing I keep hearing and reading about is the best piece of station equipment to have is an oscilloscope. I have been looking on line and I can get a very nice one for under $250. So I guess the question is to buy a used oscilloscope or a Kenwood SM-230 to go with my TS850, most SM230 are $500 plus is it worth the cost and does anyone use one?

I think you need to learn the difference between the 3 pieces of gear your post refers to .
An #1 oscilloscope - measures voltage over time , there can be some overlaps , but to keep simple
The #2 SM-230 is a band scope , or an early version of a pan-adapter , or a very limited version of a #3 spectrum analyzer - which measures frequency over time .
I think that the only reason to get a SM-230 , is to add to a collection of matching Kenwood gear [and that is limiting your possibilities { increased technology since these came out } and at too high of cost] .
If you value doing that , then the cost is not a primary issue .
If function is your primary interest , then looking at gear since then , a LP-PAN2 http://www.telepostinc.com/LP-PAN.html
Or one of the dongles , a SDR = Software Defined Radio with accompanied software = http://www.rtl-sdr.com/about-rtl-sdr/
So are you looking for form - completing a collection of matching gear ,
Or function - the current technical way to do something ?

Good morning, Steve.

In general, I regret buying my SM-230, although it's very nice looking, matches up very well with my TS-950SDX, and includes a very useful bandscope function.

If ever you have a plan to add a linear amplifier to your setup, one of the very handiest things a scope can do for you is display a trapezoid pattern that shows the linearity of the amp. The Kenwood SM-220 does that very nicely, but for some unfathomable reason when Kenwood came out with the SM-230 they completely removed that capability. Very bizarre design decision on their part.

I have two TS-950SDXs, both used with amps (a TL-922A and an SB-220) and use the SM-230 with one and an SM-220 with the other. If I were in your position, and especially if you have any anticipation of ever buying an amp, I would get an SM-220 with BS-8 (NOT BS-5) panadapter for an average of $250-$300 rather than an SM-230 at easily double that.

Note that you can not do the trapezoid pattern with a general-purpose oscilloscope, without some external adapter modules (that are easy to build). The SM-220, and most other so-called "monitor scopes", have those external adapter modules built in.

73 and welcome to ham radio.

WA7PRC >> I highly recommend the InRad roofing filter.

Good morning, Bryan.

Trouble with the roofing filter is that it completely disables the ability to use the TS-850/950 with any kind of bandscope / panadapter. So if you have any thoughts about using the bandscope function of, say, an SM-230 or SM-220 with BS-8, don't use the roofing filter.

I bought a TS-950SDX with roofing filter and removed the filter after the first time I tried to use my SM-230's bandscope function.

station monitor SM 230 with the TS 850, works well I can tell you why I use this type of system and coupling, all the functions of the second receiver provided on the 950 will be precluded but you can make some changes that are in the network, was created to the tS-950 but if you look at your 850 on the back if you have outputs with jack, you can pair it quietly on the tS 73 850

The RTL SDR Dongles won't work with the TS-850. The IF out on the back of the rig is at 8.83 MHz. The dongles RX from 24 MHz to 1.7 GHz.
You could add an upconverter, but even then, the 8.83 IF output only has a bandwidth of less than 3 kHz (2.4 I think, but my memory is soft on this one).

I did attempt to tap the First IF inside the rig and was successful, but the results were depressing as the cable picked up a ton of noise from something in the rig.

The same noise was present in the TS-450 as well.

I never figured out how to solve the noise issue.

Once again, the LP-Pan connects directly to the 850S IF output and provides I/Q signals through a good quality sound card to PowerSDR software....that combo can't be beat...check out some of the video on Youtube...

Steve KA9MOT

I would try buffering the signal at the source with a small amplifier, then run a well-shielded cable from the amp to the RTL dongle.

The amplifier should also help prevent the dongle from loading down the IF signal.

I've thought of doing this myself on a different rig (IC-740).

Rick,

I can't speak for other rigs but, in the case of my TS850S rigs, an aftermarket roofing filter does NOT limit what a bandscope (nee Panoramic Display Adapter or panadapter) can see. Referring to the block diagram on page 187 of the Service Manual, the '850 has TWO second mixers. The first one is in the signal path, and any bandwidth is affected by the 73.05 MHz roofing filter (either the OEM Kenwood filter or the OEM Kenwood filter + aftermarket InRad filter). The "2nd second mixer" (called the NB Mixer) picks the signal AHEAD of the roofing filter. Thus, the bandwidth is limited only by the bandpass filter on the RX frontend. Referring to the schematic (page 121), you'll see the wideband 8.83 MHz signal passed to the noise blanker circuitry as well as the IF OUT jack. The "2nd second mixer" is Q15 (3SK13). It is driven by Q14 (2SC2714) from the secondary of L59 which is BEFORE the roofing filter (XF1). The wideband output from Q15 passes thru L64 & L65, and winds-up at the IF OUT jack.

At that point, I have connected my Heath SB620 'Scanalyzer' and Advantest R4131B spectrum analyzer, and can sweep as wide as several hundred KHz. I could connect my Kenwood SM220 w/ BS8 but haven't bothered (Kenwood tried to do too much and didn't to it well).

I just traded my 440 for a 450 which seems to be recommend by many MARS members for use on some of the newer and more advanced data modes, like T110A, etc. Some of these modes almost require the stability that a TCXO would give. Of course, as you know, most newer transceivers come with TCXO's. I ordered one on line for $30 new from China (of course). They advertised as the same as the Kenwood S02. Will see when I get it. It will be interesting the replies you receive on your post. So far I do like the 450 over the 440 (which served me very well for over 25 years.

depends on which knob is sticky. taking the knobs off and cleaning in
mild soap is ok, the vfo knob has a set screw, but also can be adjusted for
tension, perhaps it is tight????, hold the outer ring while turning knob.
it should loosen

The grease that was applied during manufacturing is drying up. It can get to point where it can seize the control. To fix the problem, I use 3-in-One silicone oil. I remove the knobs and place the transceiver on its back. While turning the control, I place drops on the inner and outer shafts until it's free. To wipe up the excess oil, it's a good idea to have a paper towel handy.

I have one of two TS-870s for sale. SN 21000009. I think it is in great condition. No scratches on case. Face looks excellent with some very slight fading of lettering on LSB/USB and CW buttons, the ones used the most. It does not have the extension feet on the front of the radio. I have tried to find a set but have been unsuccessful. I'm not sure if it has the TXCO, SO-2 in it. Will check. I have had absolutely no issues with this radio. I haven't priced it yet. If you might be interested, I can send you some pics and we can start a dialog. I figured I would start here since I would like it to find a nice home with someone who appreciates it.

I rarely sell any of my radios but I have too many and would like to pick up another TS-590. Right now, I have a 590 on the right side of my operating position and the 870 on the left. It is one of my favorite radios both in appearance, performance and ergonomics. It certainly isn't a 590 but it is a very smooth sounding rig and the reports on my audio are always good, typical of a Kenwood.

If you're interested in talking, let me know.

Happy New Year!

Steve, N4JQQ

You are exactly correct. When I said I has sticky knobs, I ment they were hard to turn. I used the silicone lube and most are much better now although I still have one that is stubborn. It is the notch knob on the upper right side. The outer knob is ok, but the inner part is hard to turn. Thanks for the advice.

Dan, the inner shaft of the control may have been bent dut to a bump to the NOTCH knob.

I had a MIC knob that was very hard to turn due to a bent shaft on a TS-850 that I bought on eBay. I could never get it straightened to where the MIC knob would turn easily. I wound up having to replace the MIC/PWR- PROC/MON assembly.

73,
Alan, KD5R

13454. TS-450SAT: SWR Jumping high on 20M with tuner enabled and dummy load

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2016-02-09 08:17:39 UTC
From: hkzlabnet@...
Topic: 13454 Message: 13454

Hello everyone!
I'm a newly licensed Italian Ham (IU4GBM) and I recently recovered a Kenwood TS-450SAT to use as my first HF rig. The TRX shows a weird problem though and I got here trying to find a solution or some hints to help me identify the cause.

The problem is that I frequently get my SWR jumping high (2:1) erratically while the tuner is enabled (and, obviously, tuned) on the 20M band (and only on that one!).
This happens while connected to a dummy load too.

Some details:
1) I can tune a 50ohm dummy fine on all supported bands: the automatic tuning always complete succesfully and gets me down to around 1.1:1.
2) On all bands (except 20M, where the problem shows) I can put quite a bit of power inside the load and the SWR always remains under 1.1:1 (with AND without tuner enabled)
3) On 20M, if I transmit WITHOUT tuner enabled, I have no problems (tested 50W max, as my dummy load is rated for that)
4) On 20M, if I transmit WITH tuner enabled (and tuned) and stay under 10W, I have no problems (the SWR remains at 1.1:1)
5) On 20M, with tuner ENABLED and power above 15W, I begin to see the SWR jumping around after a few seconds. It gets worse if I crank the power up.

Sometimes it remains stable to 1.1:1 for around 30 seconds of continuous transmit (tested on FM and CW key down), sometimes the problem shows up immediately.
6) I have a spare tuner, swapped it and the problem shows up in the same way.
7) Checked K104 relay on the tuner, no evident problems (pulled it and checked resistance while contacts closed: <50 milli-OHM). Replaced it anyway and no difference: the problem persists.
8) Apparently, the problem disappears as soon as I go above 14.500Mhz (see video at link below, tested on a dummy load).

I took a short video to show the problem (those who suffer motion sickness, beware!)
https://youtu.be/kPMHgN8D224 https://youtu.be/kPMHgN8D224

Any idea on what could be causing such a specific problem? Only on 20M and with tuner enabled?
I can also add that I made contacts all around Europe and Israel with good reports using the rig on 20M and 40M with 10W power.

Most interesting, thank you!

I should have some spare 220pF NP0 MLCC axial caps. 100V max though, do you think this value is safe enough for the application specified in the link you posted?
I'll look around for the 100nF one too.

If they are good enough, I'll probably be able to perform the fix this weekend or the next.

We need more information than that.

What kind of TU?
Are you running AFSK or FSK?
If running FSK, do you have the 13-poin cable?
How are you interfacing fldigi to your radio?

I run FSK RTTY here with a couple of TS-450's. I use the freeware
program, MMTTY for RTTY ahd Ham Radio Deluxe for some of the outher modes.
The interfaces I use are the RASCAL's from Buxcom (Goole that for info).

Here is a link to the fldigi manual if you need it.

Ok, I disabled the computer microphone all together. Quit picking up room noises, but wouldn't show anything received or ppt light on signalink wouldn't light up on transmit. I can see the signals going down the waterfall. double checked jumper settings on internet and I had some wrong. Placed jumpers as signalink website exactly as showed for TS850. Tried again after doing whole setup again but made signalink sound card my default speakers and put windows sounds to none. Configured fldigi with signalink sound and microphone. Still showing signals on the waterfall but nothing typing out on receive screen and still doesn't light the signalink ptt light when I hit tune or tx.

I really appreciate everyone advice. I started my 7 nights of work in the ER tonight so I'll try some more when I work out next week.

Thanks!

Will not decode if time on cpu is not synced within a couple of seconds. I relearn that mistake everytime I add new computer to the mix. Use a program called "dimension" or something similar to keep cpu clock in sync so it will decode and work. Sorry to jump in..

  Ok, I disabled the computer microphone all together. Quit picking up room noises, but wouldn't show anything received or ppt light on signalink wouldn't light up on transmit. I can see the signals going down the waterfall. double checked jumper settings on internet and I had some wrong. Placed jumpers as signalink website exactly as showed for TS850. Tried again after doing whole setup again but made signalink sound card my default speakers and put windows sounds to none. Configured fldigi with signalink sound and microphone. Still showing signals on the waterfall but nothing typing out on receive screen and still doesn't light the signalink ptt light when I hit tune or tx. I really appreciate everyone advice. I started my 7 nights of work in the ER tonight so I'll try some more when I work out next week.

Some website say that serials starting with 1and 2 have old DDS chips so i bought my TS850 SAT with serial starting with 5. After 2 years one of the chips died and no more TX. I found a working DDS board with chips v2 and is working fine since almost 3 years.

Bobby,
Welcome to the hobby. It sounds like your computer settings are not correct. Your computer sound card is connected to the microphone in the computer/laptop and that is why you are seeing room noise on the waterfall. Likewise you fldigi output tones may likely be going to your computer speakers and not the audio output to the radio. I have a TS480SAT and Ham Radio Deluxe for the digital modes so I cannot give you exact directions on how to fix your problem. Just be sure to revisit the instructions on setting up your sound cards input and output.
Good luck.
Tom AF8P

Those of us (many I am afraid) who were licensed in the 70's and 80's remember the interference from the Russian "Duga" radar array, which was to serve the Russian military as an Over-the-horizon radar.

Thereis a very interesting movie documentary that you can download ($12.99 on iTunes) that has received very positive reviews. In it, the conspiracy of a relationship between the Chernobyl nuclear disaster and the Duga array is researched. Lots of closeups of the antenna are filmed - the guy actually went and climbed on the thing just metres from the still-hot reactor site!

Watch http://www.russianwoodpecker.com

Watch http://www.russianwoodpecker.com The Russian Woodpecker is a production of GraciaFilms, Roast Beef Productions, and Rattapallax. Worldwide distribution by FilmBuff.

13489. Replacement TS-850S Driver Transistors

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2016-03-06 08:16:37 UTC
From: dhalbakken.groups@...
Topic: 13488 Message: 13489

Hi,

I'm new to this group, thanks for allowing me to join.

I've been busy the last few days trying to make a TS-850S transmit again. It would not transmit when it was given to me. By going through some of the alignment procedures in the service manual, I've been able to coax about 20 watts out of it on 15 meters, maybe 30 watts on 20 meters, and about 90 watts on 40 and 80.

I suspect at least one of the 2SC2509 driver transistors has gone bad. Looking at the collectors with a scope, the amplitude and waveform is very different between the two. I think they should be equal and opposite.

Before I order some expensive 2SC1945 replacements (which I believe are the most easily obtained of the various suggested replacements), I wonder if anyone here might be able to look at the 2SC5171Q for sale at:

http://www.thepartsplace.k5nwa.com/index.php?route=product/product&path=36_37&product_id=79 http://www.thepartsplace.k5nwa.com/index.php?route=product/product&path=36_37&product_id=79

The 2SC5171Q is not advertised as an RF transistor, but it seems to have specs similar to the other 2SC2509 replacements, and it seems cheap and plentiful. One problem is that the pin-out is B-C-E instead of B-E-C, so an attempt to use it would require a bit of mechanical effort with the leads. Other than that, is there a chance the 2SC5171Q might work? It is even easily available here in Thailand!

Many thanks and 73

Dave HS0ZLG / WA0PND

Yesterday I installed some 2SC5171 transistors into my problematic TS-850S. The parts came from my favorite, local semiconductor vendor. I do not know if my parts are representative of what is available from thepartsplace, but mine seem to be original Toshiba parts.

I found that the parts I installed rolled off somewhere between 7 and 14 MHz, so they are unusable. Too bad. It might be that the parts from thepartsplace do not roll off like this.

Anyway, I'm still unsure whether the problem with this radio is actually caused by a bad 2SC2509 driver. The parts I took out seem to check out ok, at least at DC. My DMM measures the hFE on one part at 84 and the other at 88.

So I'm headed back to the workbench to look for a different source of the problem.

Dave HS0ZLG / WA0PND

13491. TS-450S CHIRP OVER 20 WATTS

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2016-03-09 02:47:13 UTC

Let me start by saying I have no idea when this started. I've been running mostly digital at low power for a couple of years. The only full power CW I've done is DX pile ups where they usually wont mention your signal quality. about a month ago I made a CW contact at about 60 watts and got a 599C report. So I turned on another receiver and started experimenting. Sure enough, as I approach 25-30 watts a chirp and click start to develop. the higher I go the worse it gets.
So far, here is what I've done. I switched out my regular 35A Astron with a 40A Tripp-lite I had under the desk. No difference. I reran and reconnected my ground. I have about a 25' ground cable going to an 8 ft ground rod. All my equipment goes to a common point in the shack, then 1 wire to the ground rod.
At full power key down I have 13.25 volts at the power supply. 13.8 idle.
I switch the rig over to the dummy load, listened on my receiver, no difference.

Its starting to look like a problem with the rig.
Has anyone run into this problem with this radio?
Thanks
Mark

Hi Mark

You might check the fuse in your DC line and check the power out at the transmitter end of the cord.

I had that problem once and I checked the fuse and it was OK but it had corroded and wasn't making good contact.

Ts-450's are notorious for chirp if the voltage is low.

Hi Dave,

I have had transistors stop working at RF frequencies while they still worked at DC.
I poked around after reading your post. I found several people reporting that the pins of the 2SC2509 are BEC, not BCE. Did you check the layout?
If you have a 10:1 probe and an oscilloscope with enough bandwidth, I would check the stages before the driver. A 1:1 probe has too much capacitance.

Good luck, and 73.

Wilko

Tom , you are a genius! I have been a ham for 41 yrs. I've had lots of problems to solve. This one had me stumped after a month of frustration. I never would have thought to pull the fuses. I spent hours scouring the web for ideas to a solution before posting here. This was never mentioned anywhere..
Today I pulled the fuses in the power cord. looked at them, did not see any corrosion. Put them back in. Fired up the 450 and another receiver just to start experimenting again and WALAH!!! Problem gone. CW sig nice and clean all the way to high power. there must have been just a bit of oxidization. they have never been pulled in the 15 yrs I've owned the rig.
I was convinced it was some oddball problem in the rig.
Just when I thought I knew everything ....hi hi.
Thanks again Tom, you saved me from having to buy that new TS-590SG......for now.

Hi Wilko,

Many thanks for your post. Yes, I still worry that my 2SC2509 drivers might not be working correctly at RF. Your experience confirms that they still might be bad. My scope is a 100 MHz model, and I've been using 10:1 probes, as you suggest. The single transistor stage before these drivers seems to be amplifying correctly, as far as I can tell, on all bands. And I've poked around in the circuits before that, too. Nothing has stood out so far as the root of the problem. When I get the time I'll get back to it.

You're right that the pinout for the Kenwood 2SC2509 is BEC, It shows that in the official service manual, and I confirmed it by following the traces on the circuit board. The datasheet for the 2SC2509 shows a pinout of BCE, so it that tends to be a bit confusing. When I substituted the 2SC5171 drivers, I bent the E and C pins, crossing them over each other before soldering them into place. A bit of teflon tubing served as an insulator on the two pins.

73,

Dave HS0ZLG / WA0PND

The corrosion might be on the fuse sockets if none was on the fuses. Worth a check, now that you are thinking about it.

Just picked up a ts-690s. It had low receive audio, so after a lot research, replaced the c104 cap on the if board. It was leaking but caught it before it damaged any close components. Audio is now where it should be, but now there is a 2 to 3 second delay before receive audio comes up after transmit. As I said everything looked very clean. I'm new to this rig so would appreciate any help. Thanks

cleaning sometimes the PCB you must use a fiber-pen over the alcohol residue may block the copper tracks, you can use these carefully because even remove the insulation film

Just picked up a ts-690s. It had low receive audio, so after a lot research, replaced the c104 cap on the if board. It was leaking but caught it before it damaged any close components. Audio is now where it should be, but now there is a 2 to 3 second delay before receive audio comes up after transmit. As I said everything looked very clean. I'm new to this rig so would appreciate any help. Thanks

13506. TS 450 SAT - a few issues

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2016-03-11 10:10:03 UTC
From: craigrobinson@...
Topic: 13506 Message: 13506

Hi,

This is my first post here so sorry if I ask questions often answered before!

I bought my TS 450 from my Ex-XYL's brother about 5 years ago. I recall he bought it new back when I was parting company with his sister in the mid 90's. I did the usual checks given it's source ..... but there were no bugs or explosive devices .....

It is exactly as I got it from him, no new issues have developed but the ATU has never worked (price reflected this) and he told me he had got someone to "tweak" the RX ..... so on the lower bands it is very noisy, even though I live in the sticks and have very little noise on my other rigs .....

Normally I use an external ATU but now I find the internal one would be useful in some circumstances:

The ATU is enabled but if switched on it does nothing, pressing the tune button does activate it, you can hear the motors running but SWR does not move from full scale. On my 160mtr doublet, when the ATU is taken out of line the SWR drops back to 1.6 to 1.8 depending on band. The net effect is SWR is far worse with the ATU inline.

Some one recently suggested a pair of diodes were the likely problem..... is this likely? What else should I check?

The RX noise issue I normally work around by having the AIP on and the ATT on ..... kills the noise and S/N on weaker signals is better.

Again it was suggested to me that there is gain control pot that tends to increase weaker signals but at the cost of a worse s/n ..... is this true? I have the service manual but can't find it. Why would anyone want the S meter to move more if it made the RX signal worse?

If it does exist what is the procedure to reverse the "tweak" and return to factory defaults?

Any advice appreciated.

was the internal antenna tuner factory installed or installed afterwards...

afterwards, this would suggest perhaps there was a step missed, jumper to cut maybe. follow the directions and verify ALL steps were done.

is the antenna tuner on?? thru/auto (I am looking at my 850, not sure if the same)

on the 850, the button must be in, before at tune can operate

Craig, the Antenna tuning unit has to have a little carrier inserted to make it function. Check that it may be the
carrier is turned down low enough it can't sense RF to tune the antenna. If you don't have a manual
download one, and it explains how to run the RF gain where the noise is eliminated and you still
have a good signal. Good luck with it, they are a great radio.

The tuner in the TS-450 won't tune much more than 3:1 SWR. If it is much more than that, it is not in the range.

I have one and if the SWR gets much more than 2.5:1, it doesn't liike to tune. 73

Dave,

Yes the tuner is on and enabled in the menu.

Not sure if it was factory installed but the previous owner did say it used to work, stopped working, was sent to the shop and worked again for a short time so whatever was fixed failed again or a new fault developed.

On the basis of what the previous owner said I have to assume it was installed correctly.

Will keep at it, thanks for the input.

Hi Tom,

No that's not it, the antenna I used for my latest tests had an SWR of around 1.8 - 2.2 on the bands I was testing so in theory well in range.

The strange thing is that the swr when the tuner was active was reading full scale not around 2 which is where the antenna is.

Just ran another test ..... 20 mtrs with a 160 mtr doublet ..... antenna showed an swr of 1.8 ..... when I press the tune button the atu runs, an swr of 2.3 is shown on the rigs meter but this does not change whilst the tuner runs.

IF the 450 works the same as the 850, the SWR meter may read high like you explain because when the tuner is activated/now in the circuit, the inductance and capacitance is now added to the antenna circuit so the SWR will be "something else" other than what the antenna is. This depends where the inductance and capacitance of the tuner is at that moment.
Like Tom said the radio will need to put out some RF, usually ten watts minimum so the SWR sensing circuit can read the R, L and C so it can tune.
The 450 manual says the "carrier" control needs to be turned up. The antenna tuner will not work with the carrier level full CCW.
Hope this helps. Bob WE6C

No, there is plenty of carrier.

As to noise do you mean just adjusting the RF gain and ATT?

I always do that but it would be nice to reverse the "tweak" that was done to it in the past so it's really info on aligning the RX stages that I'm after.

Is it a major job or can I "have a go" with simple test gear?

Thanks

Craig

HI Craig

This might seem silly, but are you sure the motors are not slipping on the cap and inductor when the motors are turning. I have also heard of this before.

BTW - I am having the same problem on one of my TS-450's, only the tuner light comes on but nothing happens. Haven't figured that one out yet :-) 73

Hi Tom,

Silly is good - often silly fixes things. My old IC751 was stuck in scan, Google told me a chip had failed ..... an impossible to get one ..... then I found a source (took weeks), was just about to order it when I decided to move the rig, unplugged the mic, it stopped scanning ..... turns out the up button on the mic was stuck!

Another silly one, my FT890, refused to switch on, power lead was OK, 13.8V at the rig ..... but corroded fuse contacts might pass volts but gave up at amps!

I'll check that tomorrow and let you know.

13516. TS-850/SAT also having antenna tuner issues

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2016-03-13 06:07:52 UTC
From: n7dlv@...
Topic: 13516 Message: 13516

I have been reading a related thread concerning an antenna tuning problem with a TS-450. I am having a
similar problem with my TS-850/SAT.

I am the original owner of the rig and it came with the tuner, factory installed. Recently, the auto tuner
stopped working. I would place the tuner in AUTO, turn the Carrier Control all the way up and then
press the AT TUNE button. The rig would go into CW Mode and the RED transmit LED would illuminate.
The receiver would mute and the SWR bar would turn on and the SWR would read above 3 to 1. However,
there is NO RF power being shown on the power meter. I could hear the tuning capacitor motors moving,
but after a moment the rig would start beeping, indicating it could not find a match. Using the MENU
function, I went into MANUAL TUNE mode where the main tuning knob and the M CH/VFO CH knob are
used to control the tuner manually. Again, when I attempted to tune the antenna tuner manually, the RED
transmit LED would illuminate, the rig would go into CW mode and the receiver would mute and the SWR
would read above 3 to 1. However, as before, no RF power was being shown on the power meter. Moving
the two controls would adjust the tuning capacitors, but the SWR would not adjust as per the SWR meter.

I could work around the problem. By adjusting the controls, then transmitting a low power carrier I could
get an SWR reading. Adjusting the controls a bit more and then taking another SWR reading, I could
eventually get an acceptable match. All bands and modes are affected. I tried resetting the CPU but that
did not help.

Any ideas as to where to start looking? According to the service manual the, AT TUNE button controls the
ATS line that goes to the IF Unit via connector IF-B/5-101 pin 4 (ATS). After that, it goes to the Digital Unit,
via connector DIG-A/4-2 pin 16 (ATS). From there, it goes through R26 (1K Ohm) powered by a 5 VDC buss
via R107 (10K Ohm), to pin 51 of IC1 MB89363B (I/O Port). That 5VDC buss powers a number of circuits
within the Digital Unit. Since the radio operates normally in all other respects, I am inclined to believe that
the 5 Volt line is OK and I find it hard to think IC1, could be bad. I do not know enough

about this circuit to
understand how IC1 commands the radio to go into CW mode, go into transmit, turns on the RED LED,
sets power to 10 watts and activates the tuner to look for a match. Because everything but the 10 watts of
carrier is also present, I am also inclined to believe that R26 is good. Your thoughts concerning this
problem would be greatly appreciated.

Eric,

Conventional wisdom (?) says that it won't be the IC! I'd look for a bad track maybe passing under an electrolytic, that was the cause of a display fault on my '850 some time back. With CAR & PWR both fully clockwise my 850 shows 10W whilst the ATU is tuning.

Thanks Ken. The CAR & PWR controls do work in all modes when transmitting. Only during AT Tuning does it
not work. I went back to the service manual and did some additional research. On Page 15 of the service
manual there is a description of the operation of the Antenna Tuner while in the AT TUNE mode along with a
simplified schematic. It describes how, when in AT TUNE, mode certain RF power functions are disabled and
others are enabled. Of particular interest are the functions of R297, Q31, Q32, Q34 and Q52. These are in
the RF Unit and are in play when the RIG is in AT TUNE mode. R297 and Q52 set the power to 10 watts
when in AT TUNE mode. If one of those or the associated circuit run is defective, that will cause the
problem I am experiencing. The electrolytic capacitors here have never been replaced. I will start looking
for a leaking electrolytic and damaged runs. If they are normal, I will look to see if R297 and or Q52 are
defective.

Curious if anyone has added the INRAD SSB filters to the TS870? Looks like the only option, i.e., SSB vs. CW.

Thanks,

Steve, N4JQQ

13523. Volume Issue With TS-850S

13525. DSP100 does't work (din cables not factory)

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2016-03-23 16:48:13 UTC
From: Fernando
Topic: 13525 Message: 13525

Hello friends,

I bought a used dsp100 without din cables for my ts850.

The matter is dsp doesn’t work. The ts850 mic control still works with dsp on and rx/tx on. No audio difference or enhance.

I assemble din cables staight pin to pin and use a stereo audio rca cable..

I read in the group this post
https://groups.yahoo.com/neo/groups/TS-850_450_690/conversations/messages/12686

If you check ts850 and dsp100 service manual, the din 13 pinout seems to be cross at pin 9/10, but if you check directly in the rigs, you can see pin 10 is ground in both.

Because of this I didn’t perform the cross. Din 6 seems to be the same pinout in both rigs too, not crossed pins.

Can you help me please?

Thank You!

Fernando

Hi Chad,
According to the information on page 21 of your user manual (http://www.kenwood.com/usa/Support/pdf/TS-450.pdf), there is no audio input connection on the REMOTE connector. However, the ACC2 connector (page 22) has some control over the front panel microphone input. You'll have to read the manual to find out how. ;-)

I've seen on a YouTube a TS-440SAT with the BHI audio DSP. I installed one in my FT-897D and love it.

Has anyone mounted one in a TS-850? I still use the TS-850 as my primary radio and I would love to improve it with the BHI DSP mounted inboard.

I have used several , 1st was Ham Radio Deluxe HRD , had some similar uses .
Then tried some of the TV-SDR dongles .
And now using LP-Pan2 .
At this time my favorite is the LP-Pan2 with E-MU 204 sound card and bought used and saved money , other wise I would have kept using the New-Elect dongle , bought new with lots of extras , the latest dongle with TCXO etc. , upconverter with added noise source , aluminum cases for both to help with noise getting in , seeing that TV-SDR dongle with all that I got was $100 + , that moving on to the LP-Pan2 was not that much to bite on .
If I was to do over again with what I know now , I would just use the LP-Pan2 .
If your more into solving computer , hardware / software issues , then maybe the dongle .
Not that it is a slam-dunk with the LP-Pan2 . should give that link
http://www.telepostinc.com/LP-PAN.html
Also bought a dead LP-100A with a simple fix , I like the company much more than the dongle companies , except for the RTL-SDR group

Hi Pat,

The short answer is yes. Now for the long answer...

Refer to the block diagram for the TS450S/TS690S Instruction Manual, page 89.

In order to see any significant bandwidth, you need to tap ahead of ALL filters, including the roofing filter after the 1st mixer. The 1st mixer is Q14-Q17 (pn 2SK520) on the RF Unit PCBA (pn X44-3130-01). The 'MCF' after the 1st Mixer has a bandwidth of about 20 KHz. You need to tap ahead of the filter.

Unlike the '850, there's no external port for this signal. However, the next-best thing exists. TP1 on the RF Unit PCBA provides a convenient connection point. See the Service Manual schematic (page 135, L2) and PCB layout (page 134, D4)

I didn't bother looking for the signal level but, I see TP1 is fed through a 2 picofarad capacitor, which tells me the level might be pretty low. You may want/need to add some gain between it and your panadapter dongle.

Check the traces around C104. The electrolyte from the cap eats the traces, depending on how long the trace was exposed. Also. I have had to remove the filters near c104 as the traces that go underneath get eaten also. Even when they look ok, they can be open. Tedious, but check with an Ohmmeter.

Happened to a friend's 450 that I fixed for him. I caught mine before it got that bad.

Just a simple thought, check the polarity of c104. Its the coupling cap for the audio amp. Not implying you don't know what you are doing, but sometimes I get things backward when I'm trying too hard.

BTW, if you haven't done it already, look to replace the battery located behind the front panel. That's what goes next.

Good Luck,
Cheers,
Tim

I have attempted to reply a few times. This is my last attempt.

Clean up the residue from C104 that has crept under the filters and maybe under other components. It most likely will require removal of the filters and other components to do. Test the traces with an Ohmmeter. Its a lot of work, but is required to fix the problem. Very typical for a c104 failure.

Tim

13544. Re: CSS line status is SOLUTION to: TS-450 Won't Key

From: zf43acb@...
Topic: 8341 Message: 13544

This thread was a great help to me, lately, so I will post my solution to help others.

My TS-450S was mangled by a non-tech type, so I got it cheap, not working. The main problems were that the battery had leaked on the Digital Board and etched away the traces adjacent, and the 12 volt line fuse would blow immediately. Fortunately, C104 had been replaced on the IF Board, before leakage damage there.

I lifted one end of L14 on the Final Board to remove power from the obviously blown power transistors, replaced the battery with a stick on surface mount battery holder, powered up and got a display of 14.000. I tried the setup menus, they appeared to work, but would not remain stored on repowering the unit. Also, the encoders would only work in one direction. It turned out to be an open address line to the RAM, where the lines run close to the battery leakage. OK, now I had a working receiver, and I could go through the receiver adjustment section of the service manual. Some of the pots had been turned to their limits, like rf gain, so I knew it needed alignment.

Ebay supplied a used Final Unit, and I purchased a set of TS-450S ribbon interconnect cables at the same time, since some of mine were mishandled and in poor condition, but seemed to be working. I replaced the Final Unit and had no more blown fuses.

When I got to the transmit adjustments, I found that the SEND button did not work, same as this thread. Using the test points on the IF Board, I could see the SS signal grounded by the SEND switch, but TXI remained low, indicating an inhibited transmit state. As pointed out by this thread, the CSS signal feeds back to the Digital Board, to request transmit mode from the processor (Fig. 18, Page 23 of Service Manual). A few checks around Q50 showed a problem, but on the Digital Board side CSS was just 5 volts, because of a 10k pullup.

My problem was a break in the 20 conductor ribbon cable between the Digital/IF Boards, on the CSS line. Replacing the ribbon with my spare solved the issue.

My analysis of the intermittent failures experienced by Kevin, in this thread, would tend to make me look at cables first, and then, of course, badly soldered or failed components.

Thanks to all who contributed to this thread, it saved me a lot of time. 73, VE6BBD

13545. Repairing TS-450 Antenna Tuner

Yahoo group: TS-850_450_690 (2010 — 2016)

Topic: 13545 Message: 13545

My C20 blew up on my antenna tuner. I've got it replaced, but I also have another problem. The last time I had the radio out (it's the backup rig), the tuner would hunt for a match, one of the capacitors would jerk back and forth. I think the indicator pot isn't in sync with where the CPU thinks it should be.

Does anyone know how to get the two pot/capacitor pairs in sync with the CPU? Do the settings in the manual mode (M.In menu 31) of 0 to 100 correspond directly with not meshed to fully meshed?

Thanks

Very good Bryan,
You are correct! When I was researching a Panadapter for the TS-450, I found TP-1 to be the perfect spot for it, and it makes it a plug in and not a solder in modification.
The problem I ran into was the noise generated inside the radio was picked up by the cable and the RTL Dongle received it and most of the signals were swallowed up by the noise.

I never found a way to resolve the noise issue.

Jean Paul,

Can you remember what was the number for the coupling capacitor in the TS-450? I think if I look at the the TS-450 service manual and the Ts-850 service manual that I can get it right the first time, and then let the group know how the modification works.

Thank you,

Mark

Please check again the pcb arround the audio output ic. Perhaps cap leakeage destroyed another fine trace of the pcb
You can find basic configuration of the ic in http://www.micropik.com/PDF/TDA2002.pdf .
Assume +vcc as your power supply setting voltage. Try to inject audio signal in the input of the amp circuit and see what happens.
If you have no signal in smeter during rx, you must think in rf input signal problems

Subject: [Bulk] [TS-850_450_690] No audio kenwood ts 450 sat

I NEED HELP. MY KENWOOD 450SAT HAS LOST ITS AUDIO, EVERYTHING ELSE SEEMS TO WORK WELL. I CHANGED THE ELECTROLYTICS, C98-99-101-104, CLEANED UP THE LEAKING C104, JUMPERED THE PLUS SIDE OF THE C104 TO THE AUDIO OUTPUT TRANSISTOR 2002V PIN 4. REPLACED THE 2002V AUDIO OUTPUT TRANSISTOR. I HAVE TRANSMITT, I CAN SEE SIGNALS ON THE SMETER, I HAVE SSB MODULATION. ANYBODY HAVE ANY IDEAS,TRYING TO FIND SCHEMATIC WITH VOLTAGES. ALL HELP ACCEPTED. JOHN WB2AUL

13550. BHI audio DSP

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2016-05-02 05:41:13 UTC
From: Jean-Paul / F1LVT

Dear Mark,
The DSP module "bhi NEDSP1061" is mounted without removing any component. It is inserted on CN15 connector, on "IF Unit", under the TS-450 transceiver.
I have build a bypass piece to connect the DSP module on the CN15 connector. The female hubs are inserted on the CN15 connector, and the male tips receive the cable connector going to the volume potentiometer. For the power supply of the DSP module, the 8V is taken on pin 3 of CN5, always on the IF Unit. The ground is on the scew, in the middle if the IF Unit.
The DSP module has been fixed on a support sheet, in place of the 455 kHz filter.

All is placed on the IF Unit, and the DSP can be very easily mounted and dismounted without soldering.
The control of the DSP level is made by a pushbutton fixed on the rear part of the transceiver.
Best regardsJean-Paul / F1LVT

  Jean Paul,
Can you remember what was the number for the coupling capacitor in the TS-450? I think if I look at the the TS-450 service manual and the Ts-850 service manual that I can get it right the first time, and then let the group know how the modification works.
Thank you,
Mark

Have and old 850 here and the VFO no longer changes the frequency. Also the last digit flickers. Have read some info on the internet about this but it mentions two variable resistors that I have not found. Also noticed that the D11 has been clipped in the radio to open it up frequency wise. The CAR board also has had the IC 1 replaced with the YM66312 but IC 2-4 are the YM6631. Looks like a lot of changes in the radio but would like to get it back to working condition. Anyone have any ideas on getting the VFO to work ?
Thanks,
Tom N8NMA

open the top and bottom cover radio, then goes on to disassemble the display after removing the knobs carefully, you see that behind the display you can find an area with an inverter in a closed canister fill slopes are two display boards the first where there are the bulbs leave it alone, you should find a 16 volt capacitor C18 470mfarad if i recall, this is usually the cause of the malfunction of the display might be gone, you realize a loss from acid spillage on the slopes, so if you can make a bridge from the side reverse of the card or clean it with a glass fiber pen

13558. PWR meter accuracy

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2016-05-08 07:33:06 UTC
From: Ervin Hegedüs
Topic: 13558 Message: 13558

Hi Folks,

I've bought a PA and an external PWR/SWR meter (Zetagi 500).

The PA max input pwr is 70W (model: TW 500, output is max 500W).

On most bands, I can drive the PA that it can be emitt the 500W, but yesterday I've realized, that on 40m the PA works only on 350-400W, but the output of TS850 is 60W (the inner PWR meter indicated that value).

I've masured the output PWR with the external meter, and it indicated only about 40W.

On 40m when I drive the RIG with full PWR, then the value will be 100W, but the external PWR meter shows 150W. On other band (yesterday I just checked 20m quickly), the inner value is equal with the external value?

What would be the reason?

does the vfo frequency change by the mike up/down functions , or change via

computer control. what about memory up/down, or by using the vfo ch
knob.....

if the others work, it may be the encoder. the flicker may be the cap as
mention previously, but I understand the complete display out is usually
the result of that cap.

13561. New 450 Owner - Auto Tuner Found...But.....

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2016-05-14 12:50:42 UTC
From: viragoxv@...
Topic: 13561 Message: 13561

Sorry for the repost, but my earlier message hasn't been posted yet so I could not revise it....

Well, I don't see how I could have missed the auto tuner, but I now have found it! It occupies a large portion of the upper right area of the radio!

Anyway, I'll test more later, but still puzzled as to why my TS-850 SAT can tune my mini-G5RV so easily but this 450 auto tuner doesn't seem capable...any difference in tuning capabilities?...thoughts?

Thanks! Mike, N3QIG

13562. New 450 Owner - Can Mic Socket Power MC-60/A? AT-450 Installed?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2016-05-14 12:02:31 UTC
From: viragoxv@...
Topic: 13562 Message: 13562

I've added a 450 to the "stable". It came with a Kenwood MC-60 mic, and according to the mic manual, no batteries are needed for the pre-amp if power is supplied from the radio's mic socket. The radio manual shows 8V available on pin #5. The mic shows two 1.5V batteries needed for the mic pre-amp. I'm assuming I don't need mic batteries because of the 8V present on pin #5.....thoughts?

BTW, the mic is marked MC-60, but according to what I've read, the 60 did not have the UP-DOWN buttons which ARE present on my mic....is my mic an MC-60A in hiding?

I'm curious to confirm whether the radio has an automatic antenna tuner; can I open the radio and confirm? What should I look for?

Thanks! Mike, N3QIG

Yes the cap is fine and display works correctly other than the VFO knob will not change it. All other functions work memory up down buttons etc. So may be the encoder.

I've added a 450 to the "stable". It came with a Kenwood MC-60 mic, and according to the mic manual, no batteries are needed for the pre-amp if power is supplied from the radio's mic socket. The radio manual shows 8V available on pin #5. The mic shows two 1.5V batteries needed for the mic pre-amp. I'm assuming I don't need mic batteries because of the 8V present on pin #5.....thoughts?

BTW, the mic is marked MC-60, but according to what I've read, the 60 did not have the UP-DOWN buttons which ARE present on my mic....is my mic an MC-60A in hiding?

I'm curious to confirm whether the radio has an automatic antenna tuner; can I open the radio and confirm? What should I look for?

Thanks! Mike, N3QIG

Topic: 13561 Message: 13568

The tuner in the 450 will only tune SWR's that are about 3:1 or less. It is not a broad range tuner. I don't know about the 850 but I would think it is similar in capabilities. Perhaps they are different enough that the 850 tunes it.

  Sorry for the repost, but my earlier message hasn't been posted yet so I could not revise it....

Well, I don't see how I could have missed the auto tuner, but I now have found it! It occupies a large portion of the upper right area of the radio!

Anyway, I'll test more later, but still puzzled as to why my TS-850 SAT can tune my mini-G5RV so easily but this 450 auto tuner doesn't seem capable...any difference in tuning capabilities?...thoughts?

Thanks! Mike, N3QIG

13569. TS-450 S-meter and ALC meter alignment

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2016-05-27 21:39:51 UTC
From: k9bf73@...
Topic: 13569 Message: 13569

Hello
I have a TS-450 that I am trying to put back in service. It works great now that I have affected a few repairs. However, the use of the adjustment menu system is confusing to me. For example, I set the S meter to S1 while injecting a 14 Mhz signal at the level indicated in the manual. All ok at this point. Now I inject an S9 level signal into the radio and the meter indicates 30 db over S9. So as per the alignment guide, I enter the adjustment menu set mode and select menu number 8. Ok, now what. I pressed the up key and then went to menu number 17 and wrote it to the EEPROM. I then turn the radio off and on again but its still at 30 over. Arrrrg. What am I missing here? Also having a problem setting the ALC meter. I feed 5 mv into the microphone input while in menu 13. I bring the mike gain up and then all of a sudden it pegs full scale. Arrrrg.
Is there anyone here who can give me some guidance? It seems to me that the service manual is missing some bit of information concerning the alignment set menu function. Either that or my brain is dying and I don't know it yet.
Thanks and 73
Ben K9BF

I use my TS-850, paired with an Elecraft K3, in a contesting "SO2R" setup. I use the ACC jack to connect to the computer serial port.

Recently, I bought a Bandmaster IV to automatically switch my 8-pack antenna switch as the rig changes bands. It, too, is wired to connect to the same ACC connector.

I'd like to "Y" both devices off the ACC connector. That is, I am planning to open up the plug fixture on the cable to serial port, or the cable to the Bandmaster, and wire the other to the needed pins.

What issues should I be alert to? I don't seem to find any data about the ACC1 jack in the TS-850 manual, so its pin functions are a bit of a mystery.

Tks,

/Bill, K2PO

Jean Paul,

I have received instructions for installation and it appears that I have three options, the first being C164, or before Q27 depending on the strength of the audio path.

It will be probably the end of July since I will be on holiday in Europe before I have time to place it in the TS-850. Again, thank you for your help and experience. I will share what I come up with. The '850 is too fine a rig to let go, so here we go!

John,
The modification (addition of a DSP) has been made for a TS-450 (and previously for a TS-440). The description is in the "New files uploaded" of the group.
Mark (rzzz350@...) wants to do the modification in a TS-850. It is why the link says TS-450 , but the title says TS-850. The DSP can be added in many transceivers, when you know how to do.
In the TS-850 where is the best place for the DSP insertion ? I do not know for the moment. I need to study the 850 schematics.

It is the TS-450.

John-Paul modified a '450 to take the BHI DSP, and I believe he had done the same earlier with a '440.

I was asking a while back about any info on using the BHI DSP in the '850.

I went over the schematic with BHI and they suggested two places to install it in the audio path.

I hope to have time to tackle it in mid-July when I get back to the US. If I get it right I will post it.

From: John tf
Topic: 13589 Message: 13590

I've come across the issue of trying to figure out unknown toroids before , I save this page .

Assessing unknown Ferrite Toroids

Ok so you have had a good day at the Rally and you have come back with a carrier bag full of ferrite toroids that "just might be useful for something". How do you find out what they are? Very few seem to be stamped with any indication of their properties, and some are 'painted' garish colours which presumably means something.

First of all there are basically two types of toroidal core, one is a sintered iron dust and is usefull at higher frequencies, and the other is one of two grades of ferrite material. The ferrite has much higher permiability (more Henries per turn) than the iron dust and is usable at much lower frequencies. Ferrite will thus make fine wide-band transformers, and baluns with bandwidths of at least a decade of frequency (e.g 3 to 30 MHz). There are a range of 'mixes' of the ferrites leading to a wide range of cores with different parameters. Several firms make ferrite material and cores and it is well worth searching for their web sites. This will not help if you do not know the properties of your Bargain cores.

The way to get some insight into the material of your cores is to measure a parameter often given as 'A' which is defined as the inductance per turn (sometimes it has a subscript 10 or 100 in which case it is the inductance of that many turns on the core. It is quite difficult to measure small inductances so wind 8 turns on the core. If you have a handheld DVM with an inductance range just put it across the coil and read the answer. Remember that you cannot have fractional turns on a toroid. every time the wire goes through the central hole it is one turn. Next you need to remember that inductance increases as the SQUARE of the turns. So if you measured 100uH, 4 turns would be 25uH, and 2 turns 6.25uH, so A is 1.56 (uH for 1 turn). You can now compare this with figures quoted for various grades of ferrite in the data sheets, and those used in published designs.

What do you do if you do not have an inductance range on your meter. The next best thing is to put a known value of capacitor with the coil to make a tuned circuit and find the resonant frequency. Lots of people will tell you that you cant 'GDO' a toroid, which is only partly true. If you put a loose wire closed-loop as a single turn through the core you can couple a GDO to that and measure the parallel resonance. You don't need to use the parallel resonance. If you feed a signal generator to the coil and a known capacitor in series you will get a minimum impedance at series resonance. So connect a large resistor 10K to 100K (it depends how sensitive your detector is.) between your signal source and the series LC circuit and connect the other end to the ground of the source. Connect an oscilloscope

or an ac milliviltmeter across the LC and swing the generator for a dip. Then use the resonance formula you learned for the RAE, trying not to get confused with the micros, millis and picos. You can even 'ring' a parallel tuned circuit with a square wave and measure the frequency of the ringing on an oscilloscope. I do recommend an inductance meter. Hand held LCR meters can be bought for a very resonable price and help to 'demystify' inductors for you. In fact, like me, you will wonder however you managed without one for so long.

What can you actually use your cores for? Without the full data it is difficult to be sure, but a good guideline is that the very high permiability cores are good for transformers and chokes, but not good for filter inductors. The lower permiability ferrite cores or the iron dust cores will work well as filter inductors. It may be a 'suck-it-and-see' decision, if the filter core gets hot with RF power applied then it is probably not the right material.

Inductors are FUN, they are one of the last of the "make it yourself" radio components.

  The link says TS-450 , but the title says TS-850 ,So which it ????
On Thu, Jun 16, 2016 at 5:39 PM, rzzz350@yahoo.com [TS-850_450_690] <TS-850_450_690@yahoogroups.com> wrote:

  Jean Paul,
I have received instructions for installation and it appears that I have three options, the first being C164, or before Q27 depending on the strength of the audio path.
It will be probably the end of July since I will be on holiday in Europe before I have time to place it in the TS-850. Again, thank you for your help and experience. I will share what I come up with. The '850 is too fine a rig to let go, so here we go!

Thank you John for the link. Finally I compared the size and color of the toroid with the more common ones and made an educated guess. It turned out to be an T106-2. I winded 20 turns of 18AWG enameled wire and bingo, now the tuner works again on all bands like a champ

13594. Kenwood TS-850 and BHI NEDSP 1061

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2016-08-07 02:24:36 UTC
From: rzzz350@...
Topic: 13594 Message: 13594

I just did the install and it works.

C164 in the IF unit was removed and that is where the Red and Blue wires of the DSP unit are soldered.

I set it up under the door of the top cover, so there is tons of room. Power comes from a nearby connector.

I will post an install guide in a couple of weeks. I was really surprised that there was excellent install information on the '440 and the '450, but not the '850. I have newer rigs in the arsenal but I really do love the '850. Probably the best radio that I have owned, and I bought it new.

Jean-Paul thank you for the ideas.

Mark

13595. TS-450S Will not power on.

Hey folks!
This is my first post here and hope to get some help. When I press the "on" button, nothing happens. The voltage goes from 13.5V to nearly 0V when I try to turn on the radio. Can there be any shorting in the circuit board?

13596. Is this list still working?

Hi all,
I have noticed this list has been very silent over the past couple of weeks. The last msg I have seen was on 8/6 and then before that there were only two msgs on 7/14.
Has this list been retired, moved or is there a problem with the moderator (s)?
Just curious.

13599. TS-850 encoder problems

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2016-08-24 20:45:12 UTC
From: Tom Jones N8NMA
Topic: 13599 Message: 13599

Hello I have posted about this before but have still not had any luck fixing it. The 850 will change frequency with the keypad and the memory channel vfo channel know knob. However it will not change frequency with the main VFO knob. The last digit just flickers. I have tried another encoder and also tried replacing IC 15 and IC 16 on the bottom of the digital board. The only thing I haven't changed is the LZ92K37 which is a non-available kenwood chip. Anybody else have any luck with a repair on this area?
Thanks
Tom N8NMA

Did you try it with a battery, or a different power supply?

Sounds to me like maybe a transistor in the power supply has gone bad, 73

I have to agree with Tom. Eliminate the power supply first. I have seen an increasing number of switch mode power supplies act in this manner lately. Try a battery off a car and then check the cables from the battery to the radio to make sure you don't have one broken partly thru. Also, check the inline fuses in the power cable to make sure the slip-on lugs are clean and tight so they can carry current along with the voltage. I have seen those get dirty, rusty, sulfated and just plain "skinned-over" over the years.

Good luck. 73,

Bob K5INW

I would recommend a know good power supply first in case the PS for the 450 is way overvoltage. I have a PS-30 with my TS-450 and the PS is the worst design I have seen. It was putting out over 20 volts to begin with. Replacing a bad transistor in the PS fixed that and thankfully no damage was incurred by the TS-450. 73 – Mike

check the power supply, sounds bad.... pass transistor maybe or regulator circuit... can you try a different radio on THAT power supply??

Topic: 13613 Message: 13613

I'm trying to get started with digital modes. I've been fighting with Easy Digi connected to my ACC2 port for 2 weeks. I've tested the Easy Digi in every conceivable way and it works perfectly. I've connected speakers to the 13 pin din and played music through the ED and both sides (RX & TX) sound great.

When I run FLDIGI the waterfall is barely visible. If I unplug the computer's output (to the rig) the waterfall looks fine. Also, no matter what I try the rig won't hear the computer. I've turned the VOX all the way down and it still won't do anything. I've even tried playing music through the ED to the rig as in the previous test. It won't key up. If I use a mic, the VOX works so it's not a problem with the VOX.

I thought I may have hooked it up backwards (looking at the wrong side compared to the schematic) but I know I soldered it correctly since I grounded pin 9 and it keyed the radio.

Is there any way to test the ACC2 port input? That's the only thing left that I can think of that might be at fault. Any other suggestions would be appreciated.

This might explain it more clearly.

Thanks for your suggestions. The radio belongs to a friend and it suddenly began to behave that way. The power supply works flawlessly. I own self a TS-450SAT, if it can be of any use? Final transistors are not shorted. I measure the voltage on the final card on the W2.

Hi Zack all...

I figured it might be something like that.

But, I was away from the computer for an extended due to serious health
issues.
But, I am healing up slowly but with great progress.

I thought that maybe since I had not been active on the list that maybe
I was removed
or if there were excessive bounces that I would not receive mail.

Thanks to all for the reply! (And see, after I posted, others followed) :-)

So, the voltage goes from 13.8 V to 0 V measured inside the radio, but the power supply is good and there is no short. (A short that forces the voltage to zero would be detectable. Something would get hot etc.)

I think you have a bad contact. Check the fuse and the fuse holders. Does the radio have a relay for DC power?

Good luck and 73,

Wilko

Wilko has a good point.

I once had the same problem and it was that the fuse in the fuse holder was not making good contact with the fuse and when I'd him 'transmit' the rig would click off.

I tightened up the fuse holder and it fixed the problem 73

Murf,

Yes, in order to see any significant bandwidth, you need to tap AHEAD of the MCF (73.05 MHz roofing filter), Ref X1. TP1 is a convenient tap point. Interestingly, the instructions for the G4HUB buffer amplifier would have you tapping AFTER the roofing filter at TP2. Doing that would severely limit the bandwidth to the panadapter.

The rig's L-C frontend bandpass filter should be at least several hundred KHz wide (via TP1). The roofing filter (via TP2), while nowhere near state of the art, should be MUCH narrower... maybe only 20 KHz at the -6dB points.

See http://tinyurl.com/wa7prc-ts450s for block diagram, schematic, and PCB images.

The radio needs an alignment. Although I don't recommend this... I've used the "passband" part of the alignment procedure in other radios (NOT A 450) to cure this. Just note all you change so you can return it to where it is now just in case.If you're not accustomed to aligning radios, procede with extreme caution. Bob WE6C

Hi Chris,
The sweep oscillator in the BS-8 for the SM-220 is known to drift terribly. I found that to be the case. Also, the CRT uses a short-persistence phosphor, which is not at all suitable for use in a panadapter. Other not so good features... the graticule isn't marked for use in a spectrum analyzer and the setups for panadapter and xmit monitor require turning knobs & switches. That's a big PITA every time you toggle between xmit and rcv. That's why I adapted my Heathkit SB-620 'Scanalyzer' to work with Kenwood's 8.83 MHz IF. Also, the SM-220 as a xmit monitor should've had triggered sweep. I use a Tektronix lab scope for xmit monitoring. OTOH, the SM-220 is a pretty box.
In any case, for the TS450S, you'll find TP1 between L54, L55, and X1 on the RF Unit PCBA. See http://tinyurl.com/wa7prc-ts450s for details.

what is the plug number and source for connecting to TP1
i have a sm-220 and a rtl-sdr dongle working with my ts-830
would be nice to be able to use one of them on my ts-450

Hi and Thanks for letting me into the group!!

I have a TS-850S and I love it! but I have a big problem I can't figure out.

When you press the PTT the red light comes on the front but no TX, no antenna tuner TX, no CAT control TX.. I replace the diodes on the RF board AND replaced the board itself...

The is no 8 volts on the TXB line..... can any one point me in the right direction??

Thanks and 73's

Glenn, WB8ROI

Hi Mike,

I did that, but to me it seems nothing happens after that.
And no change either.

Any ideas?

Hello Mike,

I did that, but no (re)action followed.
No change too.

Any ideas?

Both "carrier" and "power out" controls up? Not sure how this effects the 8 volts but seen many times the carrier control gets turned down so no TX.Bob WE6C

I am replying to this old email string as a means to test my email ability. I have sent several group emails lately and non of them have posted.

Thanks,
Tom AF8P

  I'd actually recommend a 25 volt cap in that position - it's a 13 volt rail driving an inductive load (the speaker).
